An administrator has connected devices to a switch and, for security reasons, wants the dynamically learned MAC addresses from the address table added to the running configuration. Which action must be taken to accomplish this?

- A. Use the no switchport port-security command to allow MAC addresses to be added to the configuration.
- B. Enable port security and use the keyword sticky.
- C. Set the switchport mode to trunk and save the running configuration.
- D. Use the switchport protected command to have the MAC addresses added to the configuration.

Correct Answer: B

One can configure MAC addresses to be sticky. These can be dynamically learned or manually configured, stored in the address table, and added to the running configuration. If these addresses are saved in the configuration file, the interface does not need to dynamically relearn them when the switch restarts.
