### QUESTION 1

During packet analysis of TCP flows from a SteelHead using path selection, you consistently notice that the first few packets go over one path, and subsequent packets go via another. What is the cause of this?

- A. The SteelHead attempted to optimize the traffic and failed. When the connections proceeded in passthrough they get treated differently than if they had been optimized.
- B. The SteelHead has detected that a path has gone down and therefore re-routed the traffic.
- C. QoS traffic classification has matched a configured application and moved the traffic into a different QoS class.
- D. This is normal operation of using the Application Flow Engine with path selection, as the SteelHead needs to examine several packets before it can identity the traffic.

Correct Answer: C
