### QUESTION 1

Scenario: An administrator finished installing a NetScaler appliance and configured a load balancing virtual server that has four services bound. The configured load balancing method for the virtual server is set to use least connection. The administrator later added a fifth server to the virtual server. However, when testing load balancing, the administrator finds that the virtual server is using round robin instead of least connection.

Why would the NetScaler system be using round robin as the load balancing method instead of least connection?

- A. The administrator did not save the configuration correctly.
- B. The NetScaler is using slow start mode for the virtual server.
- C. Least connection will only function when more than five servers are load balanced.
- D. Least connection is not a load balancing method that can be used for Web servers.

Correct Answer: B

---

### QUESTION 2

Scenario: An administrator introduced two new servers into a server farm; the servers can handle more traffic than the older servers. The current load balancing method set for the virtual server managing the traffic for this group of servers is least connections. The administrator wants to maintain that load balancing method but also wants to use the new servers to improve performance by sending more traffic to them than to the older servers.

Which advanced option must the administrator configure to achieve this?

- A. Max Client
- B. Service Weights
- C. Backup virtual server
- D. Global Setting Override
- E. Connection-based Spillover

Correct Answer: B

---

### QUESTION 3

In which manner can an administrator configure a NetScaler device so that it can load balance external DNS servers?

- A. Configure as an ADNS.
- B. Configure CNAME records.
- C. Configure as a DNS proxy.
- D. Configure as an End resolver.

---

Correct Answer: C

---

#### QUESTION 4

How can an administrator configure a health check for a server receiving HTTP traffic so that it monitors the response code of the server to actual client requests and NOT to probes whenever possible?

- A. Configure an HTTP-ECV monitor.
- B. Configure an HTTP-Inline monitor.
- C. Use the TCP monitor with the transparent parameter selected.
- D. Configure an HTTP monitor with the transparent parameter selected.

Correct Answer: B

---

#### QUESTION 5

Scenario: A customer has two datacenters in geographically dispersed locations, both serving content for a web-based application. Content for both datacenters should always be available.

Which method should an administrator use to make content from both datacenters available at all times?

- A. HA
- B. GSLB
- C. Content switching
- D. Backup load balancing virtual servers

Correct Answer: B
