100% Passing Guarantee  
100% Money Back Assurance

Following Questions and Answers are all new published by Oracle  
Official Exam Center

-  **Instant Download** After Purchase
-  **100% Money Back** Guarantee
-  **365 Days** Free Update
-  **800,000+** Satisfied Customers

### QUESTION 1

Your database supports an OLTP workload.

An application frequently performs update operations on an indexed column of a table; some bulk delete and insert operations are also performed.

The table is created in a locally managed tablespace with manual segment space management.

A user complains about poor response time when querying the table.

The queries mostly perform index range scans.

You notice a high number of buffer busy waits and contention on segment headers.

Which three would you investigate further to diagnose the poor response time?

- A. Check for freelist contention.
- B. Check table blocks for migrated or chained rows.
- C. Check the size of the shared pool.
- D. Check the size of the large pool.
- E. Check whether the indexes have only a few entries per block.

Correct Answer: BCE

---

### QUESTION 2

In which three situations does DB time always increase? (Choose three.)

- A. when the host is CPU bound for foreground processes
- B. when I/O wait time increases for foreground processes
- C. when more connections are made to a database instance
- D. when CPU consumption by background processes increases
- E. when wait time for data to be sent over a network increases

Correct Answer: BCD

---

### QUESTION 3

Queries on the SALES table frequently use the PROD\_ID and COST\_ID columns together in the WHERE clause. Examine the command:

```
SQL> EXECUTE dbms_stats.gather_table_stats('sh', 'sales',  
method_opt => 'for columns (prod_id, cust_id) size 1')
```

Which three statements are true about executing this command?

- A. It creates extended statistics for the column group (PROD\_ID and CUST\_ID).
- B. It improves the cardinality estimates when both the PROD\_ID and CUST\_ID columns are used in the WHERE clause.
- C. It creates a virtual column for the column group (PROD\_ID and CUST\_ID).
- D. It improves the selectivity estimates of a single predicate in the WHERE clause.
- E. It gathers individual column statistics for the PROD\_ID and CUST\_ID columns.

Correct Answer: ACD

#### QUESTION 4

Which two statements are true about the interpretation of Buffer Cache Hit Ratio in the Instance Efficiency Percentages section of an AWR report? (Choose two.)

- A. A high value indicates that the buffer cache is adequately sized for the current workload.
- B. Poor hit ratios indicate that a large number of indexed lookups or small table scans are being performed.
- C. A low hit ratio does not necessarily imply that increasing the size of the buffer cache will improve performance.
- D. A high hit ratio may indicate that repeated scanning of the same large table or index is being performed.
- E. A low hit ratio indicates that a KEEP buffer pool should be configured based on the size of the largest object accessed in the buffer cache.

Correct Answer: CE

#### QUESTION 5

In your database, the locally managed tablespace, USERS, has the default space usage alert set to 85% for the warning level and 97% for the critical level.

Which two statements are true? (Choose two.)

- A. Alerts are recorded in both Oracle Enterprise Manager Cloud Control and DBA\_OUTSTANDING\_ALERTS only when the critical threshold is exceeded.
- B. Alert settings for the warning and critical levels must be disabled before taking the USERS tablespace offline.
- C. Alerts that are triggered are automatically recorded in DBA\_ALERT\_HISTORY after they are cleared.
- D. Alerts are triggered when the space usage reaches the warning level, again when it reaches the critical level, and yet

again when the space usage falls below the critical level.

Correct Answer: AB
