-  **800,000+** Satisfied Customers

QUESTION 1

Your company decided to move a few applications to Oracle Cloud Infrastructure (OCI) in the US West (us-phoenix-1) region.

You need to design a cloud-based disaster recovery (DR) solution with a requirement to deploy the DR resources in the US East (us-ashburn-1) region to minimize network latency.

What is the recommended deployment?

- A. Deploy production and DR applications in two separate virtual cloud networks (VCNs), each in different regions, and then use VCN local peering gateways for connectivity.
- B. Deploy production and DR applications in two separate VCNs, each in different regions. Connect them using a VCN remote peering connection.
- C. Deploy production and DR applications in the same VCN. Create production subnets in one AD, and DR subnets in another AD (assume a multi-AD region).
- D. Deploy production and DR applications in two separate VCNs in different availability domains (ADs) within the primary region, and then use a VCN remote peering connection for connectivity.

Correct Answer: A

Remote VCN peering is the process of connecting two VCNs in different regions. The peering allows the VCNs' resources to communicate using private IP addresses without routing the traffic over the internet or through your on-premises network.

QUESTION 2

How can you provide users access to an existing compartment?

- A. by granting users access to a compartment when the compartment is created
- B. by adding users to a group and defining a policy to provide the group access to the compartment
- C. by adding users to a compartment. All users in the compartment will have access to the objects in the compartment.
- D. by granting access directly to the user when the user is created

Correct Answer: B

A policy is a document that specifies who can access which Oracle Cloud Infrastructure resources that your company has, and how. A policy simply allows a group to work in certain ways with specific types of resources in a particular compartment

In general, here's the process an IAM administrator in your organization needs to follow:

Define users, groups, and one or more compartments to hold the cloud resources for your organization.

Create one or more policies, each written in the policy language. Place users into the appropriate groups depending on the compartments and resources they need to work with.

Provide the users with the one-time passwords that they need in order to access the Console and work with the compartments. For more information,

QUESTION 3

You are about to deploy an e-business application on Oracle Cloud Infrastructure and one of the requirements is to use a shared file system that supports the NFS protocol. Which storage service would meet this requirement?

- A. object storage
- B. block volume
- C. data transfer appliance
- D. file storage

Correct Answer: D

Use the File Storage service when your application or workload includes big data and analytics, media processing, or content management, and you require Portable Operating System Interface (POSIX)-compliant file system access

semantics and concurrently accessible storage. The File Storage service is designed to meet the needs of applications and users that need an enterprise file system across a wide range of use cases, including the following:

General Purpose File Storage: Access to an unlimited pool of file systems to manage growth of structured and unstructured data.

Big Data and Analytics: Run analytic workloads and use shared file systems to store persistent data. **Lift and Shift of Enterprise Applications:** Migrate existing Oracle applications that need NFS storage, such as Oracle E-Business Suite and

PeopleSoft.

Databases and Transactional Applications: Run test and development workloads with Oracle, MySQL, or other databases.

Backups, Business Continuity, and Disaster Recovery: Host a secondary copy of relevant file systems from on premises to the cloud for backup and disaster recovery purposes. **MicroServices and Docker:** Deliver stateful persistence for containers. Easily scale as your container-based environments grow.

QUESTION 4

Your company has decided to move a few applications to Oracle Cloud and you have been asked to design it for both High Availability (HA) and Disaster Recovery (DR). Which two should you consider while designing your Oracle Cloud Infrastructure architecture? (Choose two.)

- A. Region
- B. Instance Shape
- C. Compartments

D. Availability Domain

Correct Answer: AD

QUESTION 5

Which three must be configured for a load balancer to accept incoming traffic? (Choose two.)

- A. a listener
- B. a back-end server
- C. a back end set
- D. a security list that is open on a listener port
- E. a certificate

Correct Answer: ABC

https://docs.cloud.oracle.com/iaas/Content/Balance/Tasks/managingloadbalancer.htm?tocpath=Services%7CLoad%20Balancing%7C_____5

The essential components for load balancing include:

?A load balancer with pre-provisioned bandwidth.

?A backend set with a health check policy. See Managing Backend Sets. ?Backend servers for your backend set. See Managing Backend Servers. ?One or more listeners . See Managing Load Balancer Listeners. ?Load balancer subnet

security rules to allow the intended traffic. To learn more about these rules, see Security Rules.

?Optionally, you can associate your listeners with SSL server certificate bundles to manage how your system handles SSL traffic. See Managing SSL Certificates
