### QUESTION 1

Which service is NOT supported by Oracle Cloud Infrastructure CLI?

- A. load balancer
- B. compute
- C. database
- D. block volumes

Correct Answer: D

References: <https://docs.cloud.oracle.com/iaas/Content/API/Concepts/cliconcepts.htm#services>

---

### QUESTION 2

Which of the following statement is true regarding Oracle Cloud Infrastructure Object Storage Pre-Authenticated Requests?

- A. It is not possible to create pre-authenticated requests for "archive" storage tier
- B. Changing the bucket visibility does not change existing pre-authenticated requests
- C. It is not possible to create pre-authenticated requests for the buckets, but only for the objects
- D. Pre-authenticated requests don't have an expiration

Correct Answer: B

Pre-authenticated requests provide a way to let users access a bucket or an object without having their own credentials, as long as the request creator has permissions to access those objects. For example, you can create a request that lets

an operations support user upload backups to a bucket without owning API keys. Or, you can create a request that lets a business partner update shared data in a bucket without owning API keys.

When you create a pre-authenticated request, a unique URL is generated. Anyone you provide this URL to can access the Object Storage resources identified in the pre-authenticated request, using standard HTTP tools like curl and wget.

Understand the following scope and constraints regarding pre-authenticated requests:

Users can't list bucket contents.

You can create an unlimited number of pre-authenticated requests. There is no time limit to the expiration date that you can set. You can't edit a pre-authenticated request. If you want to change user access options in response to changing

requirements, you must create a new pre-authenticated request. The target and actions for a pre-authenticated request are based on the creator's permissions. The request is not, however, bound to the creator's account login credentials. If

the creator's login credentials change, a pre-authenticated request is not affected. You cannot delete a bucket that has

a pre-authenticated request associated with that bucket or with an object in that bucket.

Understand the following scope and constraints regarding public access:

Changing the type of access is bi-directional. You can change a bucket's access from public to private or from private to public.

Changing the type of access doesn't affect existing pre-authenticated requests. Existing pre-authenticated requests still work.

---

### QUESTION 3

Which two resources reside exclusively in a single Oracle Cloud Infrastructure Availability Domain? (Choose two.)

- A. Identity and Access Management Groups
- B. Object Storage
- C. Web Application Firewall policy
- D. Block volume
- E. Compute instance

Correct Answer: DE

Availability Domain-Specific Resources DB Systems ephemeral public IPs instances: They can be attached only to volumes in the same availability domain. subnets: When you create a subnet, you choose whether it is regional or specific to an availability domain. Oracle recommends using regional subnets. volumes: They can be attached only to an instance in the same availability domain.

---

### QUESTION 4

You are designing a networking infrastructure in multiple Oracle Cloud Infrastructure regions and require connectivity between workloads in each region. You have created a dynamic routing gateway (DRG) and a remote peering connection.

However, your workloads are unable to communicate with each other.

What are two reasons for this? (Choose two.)

- A. The security lists associated with subnets in each virtual cloud network (VCN) do not have the appropriate ingress rules
- B. Identity and Access Management (IAM) policies have not been defined to allow connectivity across the two VCNs in different regions
- C. A local peering gateway needs to be created in each VCN with a default route rule added in the route table forwarding the traffic to the local peering gateway
- D. An Internet gateway needs to be created in each VCN with a default route rule added in the route table forwarding the traffic to the Internet Gateway

E. The route table associated with subnets in each VCN do not have a route rule defined to forward the traffic to their respective DRGs

Correct Answer: AE

Setting Up a Remote Peering

Create the RPCs: Each VCN administrator creates an RPC for their own VCN's DRG. Share information: The administrators share the basic required information. Set up the required IAM policies for the connection: The administrators set up

IAM policies to enable the connection to be established.

Establish the connection: The requestor connects the two RPCs (see Important Remote Peering Concepts for the definition of the requestor and acceptor). Update route tables: Each administrator updates their VCN's route tables to enable

traffic between the peered VCNs as desired.

Update security rules: Each administrator updates their VCN's security rules to enable traffic between the peered VCNs as desired.

---

## QUESTION 5

Which three must be configured for a load balancer to accept incoming traffic? (Choose two.)

- A. a listener
- B. a back-end server
- C. a back end set
- D. a security list that is open on a listener port
- E. a certificate

Correct Answer: ABC

[https://docs.cloud.oracle.com/iaas/Content/Balance/Tasks/managingloadbalancer.htm?tocpath=Services%7CLoad%20Balancing%7C\\_\\_\\_\\_\\_5](https://docs.cloud.oracle.com/iaas/Content/Balance/Tasks/managingloadbalancer.htm?tocpath=Services%7CLoad%20Balancing%7C_____5)

The essential components for load balancing include:

?A load balancer with pre-provisioned bandwidth.

?A backend set with a health check policy. See Managing Backend Sets. ?Backend servers for your backend set. See Managing Backend Servers. ?One or more listeners . See Managing Load Balancer Listeners. ?Load balancer subnet security rules to allow the intended traffic. To learn more about these rules, see Security Rules.

?Optionally, you can associate your listeners with SSL server certificate bundles to manage how your system handles SSL traffic. See Managing SSL Certificates
