QUESTION 1

You are using the Check Availability feature to explore alternative ways of promising a batch of five fulfillment lines in simulation mode.

Which three attributes can you change to explore other promising options? (Choose three.)

- A. Requested Quantity
- B. Requested Ship-from warehouse
- C. Requested shipping method
- D. Allow substitute items
- E. Requested ship date
- F. Scheduled ship date

Correct Answer: BCD

The values for the attributes that begin with requested, such as the Requested Item attribute and the Requested Ship-from Warehouse attribute, are initially determined by what the values are when you select the line in the Order Orchestration work area. You cannot change the values for many of the requested attributes, such as the Requested Item attribute, the Requested Quantity attribute, and the Requested Ship Date attribute. You can change or clear the values for the Requested Ship-from Warehouse attribute and the Requested Shipping Method attribute. There are also some additional attributes you can change, such as whether substitutions are allowed, to influence the results when you explore other promising option.

QUESTION 2

Your company wants to define different status conditions for fulfillment lines that have different categories assigned to a single orchestration process in Order Management Cloud.

Which two configurations would you perform to meet this requirement? (Choose two.)

- A. Define a fulfillment line status rule set for each category.
- B. Create a unique step for each category and assign different "next expected task statuses."
- C. Define orchestration process status values for each category.
- D. Assign the status catalog to the orchestration process.

Correct Answer: CD

An orchestration process is a predefined business process that coordinates the orchestration of physical goods and activities within a single order and automates order orchestration across fulfillment systems.

QUESTION 3

Identify the transformation type in which a transactional item attribute is used for transforming a product. The transformation may be added to the existing product or replace the product on the sales order for a CTO item.

- A. Attribute to Product
- B. Product to Product
- C. Context to Product
- D. Attribute to Attribute

Correct Answer: A

An attribute-to-product transformation uses transactional attributes to transform an attribute to an item number. It can add the transformation to an existing item or replace the item that the source order references. Assume your company receives orders for an MP3 player that includes a Color attribute and a Size attribute, and that you must use a combination of these attributes to reference an item number. In the following example, a transformation rule transforms the Color and Size attributes of the Mini Plus item to the VIS481 item. Order Management displays VIS481 on the order line.

QUESTION 4

Your customer is using Oracle Social Network for Order Management. They claim a conversation is being created for every order in the system, and that this is not required for automated order fulfillment.

What can be changed so that Oracle Social Network only creates conversations for sales orders that need them?

- A. When enabling the Sales Order object for Oracle Social Network use the manual mode.
- B. Disable the Sales Order object for Oracle Social Network.
- C. Turn off all conversations in Oracle Social Network.
- D. Remove access from users for certain orders that do not require conversations.
- E. When enabling the Sales Order object for Oracle Social Network, use the automatic mode.

Correct Answer: A

Create social conversations only for conversations that the Order Entry Specialist manually initiates for each sales order. It is strongly recommended that you choose Manual.

QUESTION 5

Which two statements describe Net Change Collection? (Choose two.)

- A. Data for the selected entities is replaced in the planning data repository.
- B. It completely refreshes the planning data repository.
- C. Data for the selected entities is deleted from the planning data repository.
- D. It collects only changed data to the planning data repository.

E. It collects data only incrementally to the planning data repository.

Correct Answer: BE
