QUESTION 1

As of vRealize Operations (vROps) version 6.1, remote collectors can be configured into collector groups. Why is this significant? (Choose the best answer.)

- A. If the collecting node fails, another node in the collecting group can take over and resume collection
- B. The more nodes in a collection group, the more collected metric data can be buffered and stored in the case of a network outage
- C. Configuring a collector group, the nodes can be configured in an active-active mode which will allow for faster and increased capacity collections
- D. Remote collectors of different vROps versions can be run in a collector group

Correct Answer: D

QUESTION 2

The inventory tree allows a user to navigate to various topics.

In order to add a management pack, to which topic would a user need to navigate?

- A. Administration
- B. Environment
- C. Alerts
- D. Content

Correct Answer: B

QUESTION 3

Why would a user apply a filter to a View?

- A. To restrict unauthorized users from seeing the data
- B. To prevent the View from being displayed on a particular badge
- C. To limit the View to a specific report
- D. To narrow the focus of the View by adding additional criteria

Correct Answer: C

QUESTION 4

Endpoint Operations provides the native ability to monitor supported operating systems and applications within vRealize Operations.

What are additional capabilities of Endpoint Operations? (Choose the best answer.)

- A. Script monitors, hardware monitors and anti-virus
- B. Process monitors, script monitors and patch monitors
- C. Security monitors, hardware monitors and patch monitors
- D. Remote monitors, process monitors and script monitors

Correct Answer: D

QUESTION 5

View the exhibit.

The screenshot shows the 'Alert Definition Workspace' in vRealize Operations. On the left, a checklist shows three steps: '1. Name and Description', '2. Base Object Type', and '3. Alert Impact', all marked with green checkmarks. Below this, the 'Alert Definition' configuration is shown:

- Impact: Health (dropdown)
- Criticality: Symptom Based (dropdown)
- Alert Type and Subtype: Virtualization/Hypervisor: Perform (dropdown)
- Wait Cycle: 2 (input field, highlighted with a red box)
- Cancel Cycle: 1 (input field)

On the right, the 'Alert Definition Summary' is displayed:

- Name: Virtual machine has disk I/O latency problem caused by snapshots
- Base Object Type: Virtual Machine
- Impact: Health
- Criticality: Symptom Based
- Alert Type: Virtualization/Hypervisor: Performance

Below the summary, the 'Symptoms' section is visible:

- Match: All (dropdown) of the following symptom sets
- Self-Virtua Machine (dropdown)
- This symptom set is true when: Base object exhibits Any (dropdown) of the following symptoms.

At the bottom, three symptom definitions are listed, each with a red 'X' icon:

1. Virtual machine CPU I/O wait is at Critical level (X)
2. Virtual machine CPU I/O wait is at Immediate level (X)
3. Virtual machine CPU I/O wait is at Warning level (X)

As shown in the exhibit, with a wait Cycle of 2 and a Cancel Cycle of 1, when will the alert be triggered by default?

- A. 10 minutes

B. 5 minutes

C. 2 minutes

D. 1 minute

Correct Answer: A
