-- Exhibit -

Refer to the exhibits.

An LTM Specialist has configured a virtual server to distribute connections to a pool of application servers and to offload SSL processing. The application fails to work as expected when connecting to the virtual server. It does work when

clients connect directly to the application. Two packet captures were taken at the application server.

What is the root cause of the problem?

- A. The application servers are NOT listening on port 80.
- B. The LTM device is sending non-SSL traffic to an SSL port.
- C. The virtual server does NOT have a clientSSL profile assigned.
- D. The SSL handshake between the LTM device and the server is failing.

Correct Answer: B

QUESTION 5

Which command should the LTM Specialist execute on the active LTM device to force a failover to the standby node and restore web browsing?

- A. tmsh /sys failover standby
- B. tmsh run /sys failover standby
- C. tmsh /sys failover status standby
- D. tmsh run /sys failover status standby

Correct Answer: B
