QUESTION 1

Which description of BGP authentication is true?

- A. MD5 has been used by BGP to encrypt BGP update packets.
- B. BGP uses a message-digest algorithm to authenticate BGP peers
- C. A plain-text password authentication is an option of BGP authentication
- D. EBGP peers authentication is faster than IBGP peers authentication
- E. BGP uses public key and private key to authenticate BGP peers.

Correct Answer: B

BGP Authentication

BGP supports MD5 authentication between neighbors, using a shared password. It is configured under BGP router configuration mode with the command `neighbor {ip-address | peer-group- name} password password`.

When authentication is configured, BGP authenticates every TCP segment from its peer and checks the source of each routing update. Most ISPs require authentication for their EBGP peers.
