QUESTION 1

Consider a large metro-to-metro VPLS network interconnected with a mesh of mesh-SDPs. Which of the following statements does NOT apply to this situation?

- A. Bandwidth and replication inefficiency can occur on inter-metro links if there is a lot of multicast traffic
- B. The number of control sessions grows exponentially in a fully meshed network.
- C. Spanning-tree is required to prevent loops when using mesh SDPs on the inter-metro links.
- D. Network touches increase with each node added to the mesh.

Correct Answer: C

QUESTION 2

How many designated ports are there in a spanning tree topology?

- A. The same as the number of alternate ports in the topology
- B. 1 per segment
- C. The same as the number of root ports
- D. 1 per switch

Correct Answer: B

QUESTION 3

Multiple VPLS services can be offered over the same set of LSP tunnels?

- A. TRUE
- B. FALSE

Correct Answer: A

QUESTION 4

What are the limitations of a traditional layer 2 switch? (Choose 3)

- A. Isolates collision domains.
- B. Requires layer 2 loop prevention.
- C. Slow response to topology changes.

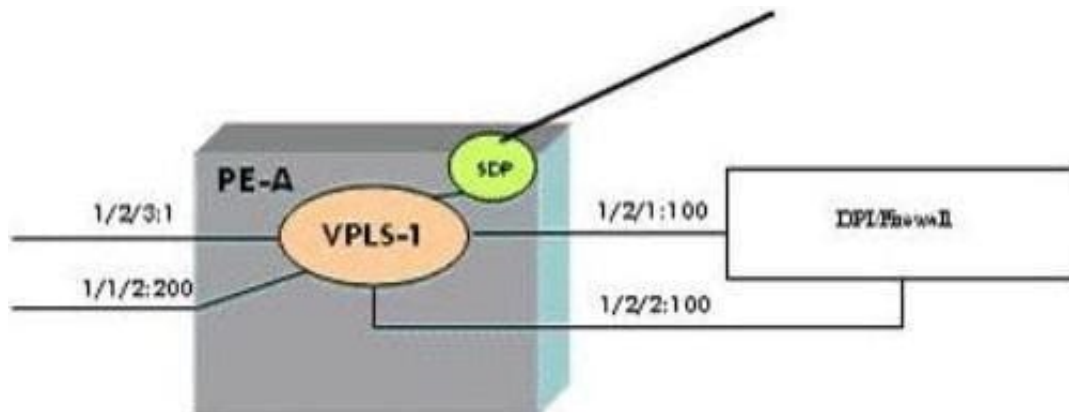

D. Limited to 4094 vlans per switch.

E. Increased flooding.

Correct Answer: BCD

QUESTION 5

Click on the exhibit below.

In the following diagram, traffic ingressing on SAP 1/2/3:1 will be passed to the layer-2 DPI device for inspection based on a filter policy applied to the ingress of the SAP. What feature should be enabled on SAP 1/2/1:100 and SAP 1/2/2:100 to ensure that incorrect information is not populated in the FDB of VPLS 1?

- A. Learning should be disabled on both SAPs connected to the DPI device to prevent FDB instability
- B. A MAC filter should be applied to both SAPs connected to the DPI to limit MAC learning on the port
- C. An IP filter should be applied to both SAPs connected to the DPI to prevent FDB instability
- D. The SAPs connected to the DPI should be configured with the "discard-unknown" feature to limit MAC learning on the port

Correct Answer: A
