QUESTION 1

A virtual machine is unable to access one of its virtual disks.

Which vSAN Health check should an administrator view to troubleshoot the issue?

- A. Data > vSAN Object Health
- B. Cluster > vSAN CLOMD Liveness
- C. Cluster > Disk Format Version
- D. Limits > vSAN Component Limit

Correct Answer: A

QUESTION 2

Which two features are available with the Cluster Quickstart wizard? (Choose two.)

- A. Deploy a vSAN Witness appliance
- B. Update storage controller drivers
- C. Check for errors and inconsistencies
- D. Setup lockdown mode for vSAN hosts
- E. Perform pre-check evaluation for data migration

Correct Answer: BC

QUESTION 3

Which storage policy action results in a component resync?

- A. Enabling object checksum
- B. Changing object space reservation to thick provisioning
- C. Adding an IOPS Limit rule to a storage policy
- D. Changing the failure tolerance method

Correct Answer: D

QUESTION 4

A single disk in a vSAN disk group suffers from an unrecoverable hardware failure. This causes vSAN to set the health status for all disks in the group to Permanent disk loss, indicating disk failure.

Assuming all other disks have not suffered from a hardware failure, why would vSAN mark all disks in the group as failed?

- A. The vSAN disk management service has failed.
- B. The affected vSphere host is offline.
- C. The key management server is offline.
- D. Deduplication and compression are enabled on the vSAN cluster.

Correct Answer: A

QUESTION 5

An administrator wishes to prevent notifications of vSAN Health status during a scheduled maintenance window.

What can be done to achieve this?

- A. Disable SNMP service
- B. Disable the performance service
- C. Run performance diagnostics prior to scheduled maintenance
- D. Silence the alert from the HTML client

Correct Answer: A
