**QUESTION 1****Scenario 2:**

After completing the branch activation activities for all required branches, the network administrator attempts to test connectivity between the various branches and between the hubs and branches. The administrator notices a lack of connectivity despite being certain that configurations have been complete. The administrator also observed that several users are reporting intermittent connectivity to some of the applications they are accessing. Other users are reporting no access to these applications. Other users at some of the branches claim they cannot get to certain public resources. The administrator wants to ensure that all sites can talk to each other and all resources are accessible.

Exhibit.

Users at the London site are complaining of various intermittent issues around websites not loading, or applications being remotely accessed disconnecting sporadically and reconnecting after a few minutes. The network administrator does not see anything strange on the Edge overview page and decides to check if the CPU or memory have been hitting close to 100?

Where should the administrator verify this information?

- A. In the VCO > Test 8c Troubleshoot > Remote Diagnostics > System Status
- B. In the VCO > Monitor > Click London_Site01 > Click the System Tab
- C. In the VCO > Remote Troubleshooting > Remote Actions > System Status
- D. In the VCO > Monitor > Alerts

Correct Answer: B

**QUESTION 2**

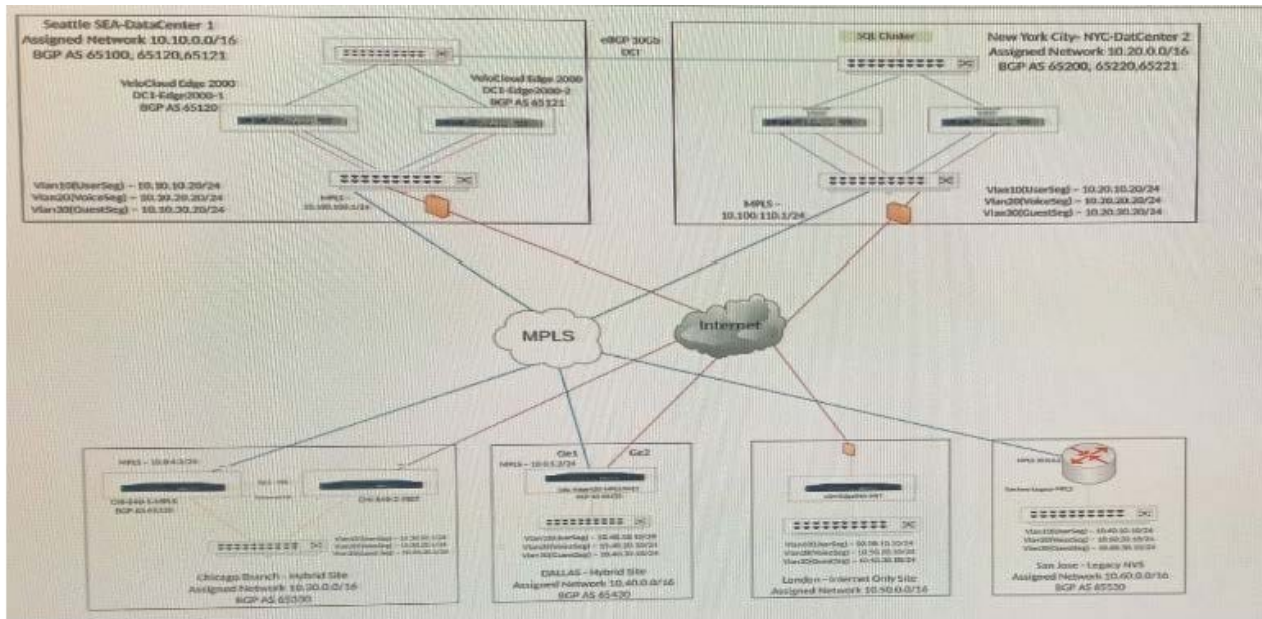

Scenario 1:

The Dallas Branch location is having issues getting activated. The local network administrator is aware that the Edge device received a DHCP address and was able to connect to the internet. The Orchestrator is reporting the Edge as Down. No other changes were made post activation.

A network administrator is tasked with enabling SD-WAN at three branch locations. A topology has been provided for reference. For each site, the administrator is having issues bringing edges

online, as another administrator has gone ahead and created a configuration ahead of time. The organization has several branch sites. One is an Internet-only site and two are Hybrid locations with both internet and MPLS. The last location is MPLS only. There are hub data center locations in this environment as well. Please refer to the topology.

Refer to the Exhibit(s).

Interface Settings									
Add Subinterface Add Secondary IP Add WAN Stack									
Switch Port Settings Routed Interface Settings									
Actions	Interface	Mode	VLANs	Addressing	WAN Overlay	Segment	Multicast		
Edit	LAN1	Access	1 - Corporate			Global Segment	IGMP	PIM	VNF Insertion
Edit	LAN2	Access	1 - Corporate			Global Segment			
Edit	LAN3	Access	1 - Corporate			Global Segment			
Edit	LAN4	Access	1 - Corporate			Global Segment			
Edit	LAN5	Trunk	1 - Corporate 10 - UserSeg 20 - VoiceSeg 30 - GuestSeg			Global Segment Global Segment Global Segment Global Segment			
Edit	LAN6	Access	1 - Corporate			Global Segment			
Edit	LAN7	Access	1 - Corporate			Global Segment			
Edit	LAN8	Access	1 - Corporate			Global Segment			
Edit	GE1	Access	1 - Corporate	Static: 10.0.0.1/24 Gateway: 19.0.0.1	User Defined	all segments			
Edit	GE2			DHCP	User Defined	all segments			
Edit	SFP1			DHCP	Auto Detect	all segments			
Edit	SFP2			DHCP	Auto Detect	all segments			
Edit	WLAN1	Wifi	1 - Corporate			Global Segment			
Edit	WLAN2	Interface disabled							

View the recommended method to configure interfaces at the profile and edge level.

WAN Settings						
Add User Defined WAN Overlay						
Type	Name	Interfaces	Link Type	Public IP	Alerts	
User Defined	INET	GE1	Public Wired			
User Defined	MPLS	GE2	Private Wired			

What is the cause of this issue?

- A. The activation link did not specify the updated image location requiring the Edge to be re-activated.
- B. The activation link did not contain any post-activation configuration to allow the Orchestrator to communicate with the Edge.
- C. The Edge will be offline for about 4 hours until it has completed the factory image installation.
- D. The activation link contained incorrect configurations for WAN overlays and WAN interfaces.

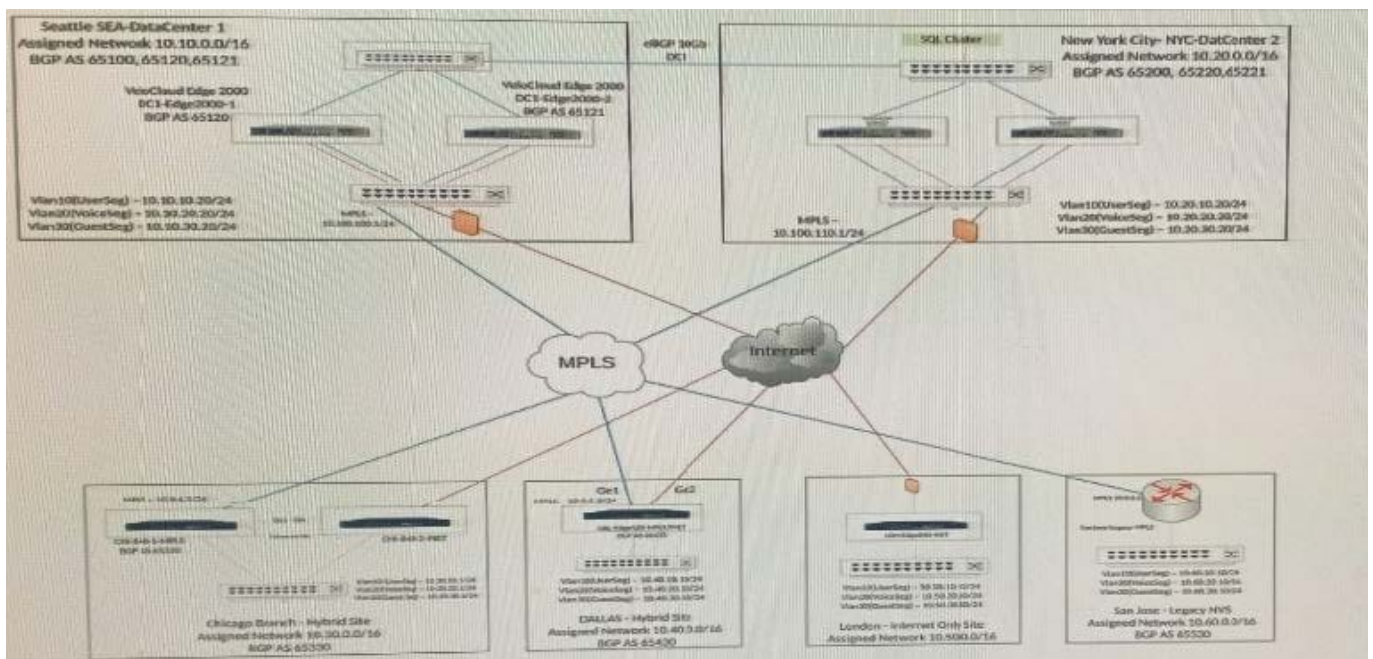

Correct Answer: A

QUESTION 3

Scenario 1:

A network administrator is tasked with enabling SD-WAN at three branch locations. A topology has been provided for reference. For each site, the administrator is having issues bringing edges online, as another administrator has gone ahead and created a configuration ahead of time. The organization has several branch sites. One is an Internet-only site and two are Hybrid locations with both internet and MPLS. The last location is MPLS only. There are hub data center locations in this environment as well. Please refer to the topology.

Exhibit.

When attempting to activate an Edge, after clicking on the "activation link" in the email that was sent to the network administrator, the Edge's local UI shows as "Internet down". This is preventing the Edge from coming online and being activated. When referring to the output, the network administrator notices that the Edge has received DHCP addressing.

What could be preventing the Edge from coming online?

- A. The next hop does not respond to ICMP pings.
- B. Cloud VPN is not enabled in the AMER Branch profile.
- C. The subnet mask assigned to the Edge is incorrect.
- D. The Edge's profile does not specify the correct Edge Model.

Correct Answer: A

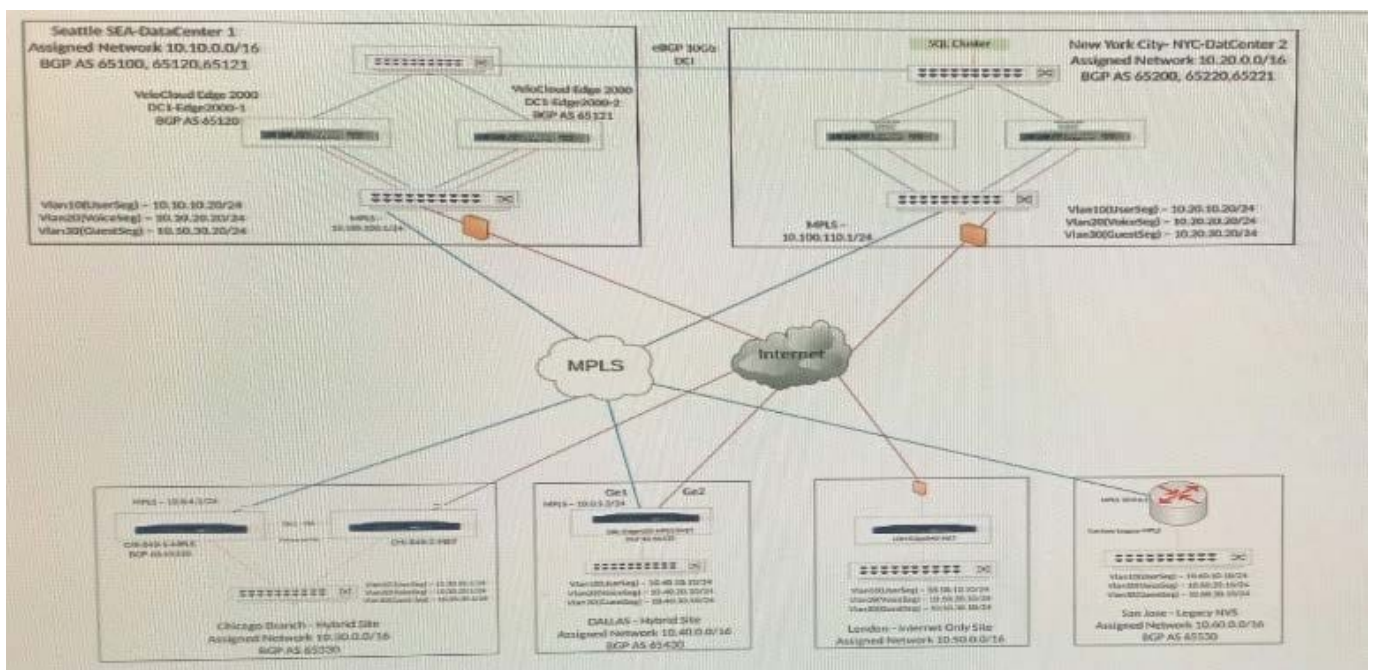

QUESTION 4

Scenario 1:

A network administrator is tasked! with enabling SO-WAN at three branch locations. A topology has been provided for reference. For each site, the administrator is having issues bringing edges online, as another administrator has gone ahead and created a configuration ahead of time. The organization has several branch sites- One is an Internet- only site and two are Hybrid locations with both internet and MPLS: The last location is MPLS only. There are hub data center locations in this environment as well. Please refer to the topology.

Exhibit.

An administrator is attempting to activate two Edge devices at the Chicago branch location. The local technician reports that the Edge devices are not coming online. The Edge devices have been plugged in, powered on, and connected to the correct circuits with an Enhanced HA setup.

What should the local technician check first when troubleshooting the issue?

- A. Verify beep sequence of the Edge devices.
- B. Review color of the LED.
- C. Review the Orchestrator for HA misconfiguration issues.
- D. Verify the link light sequence of the HA ports.

Correct Answer: B

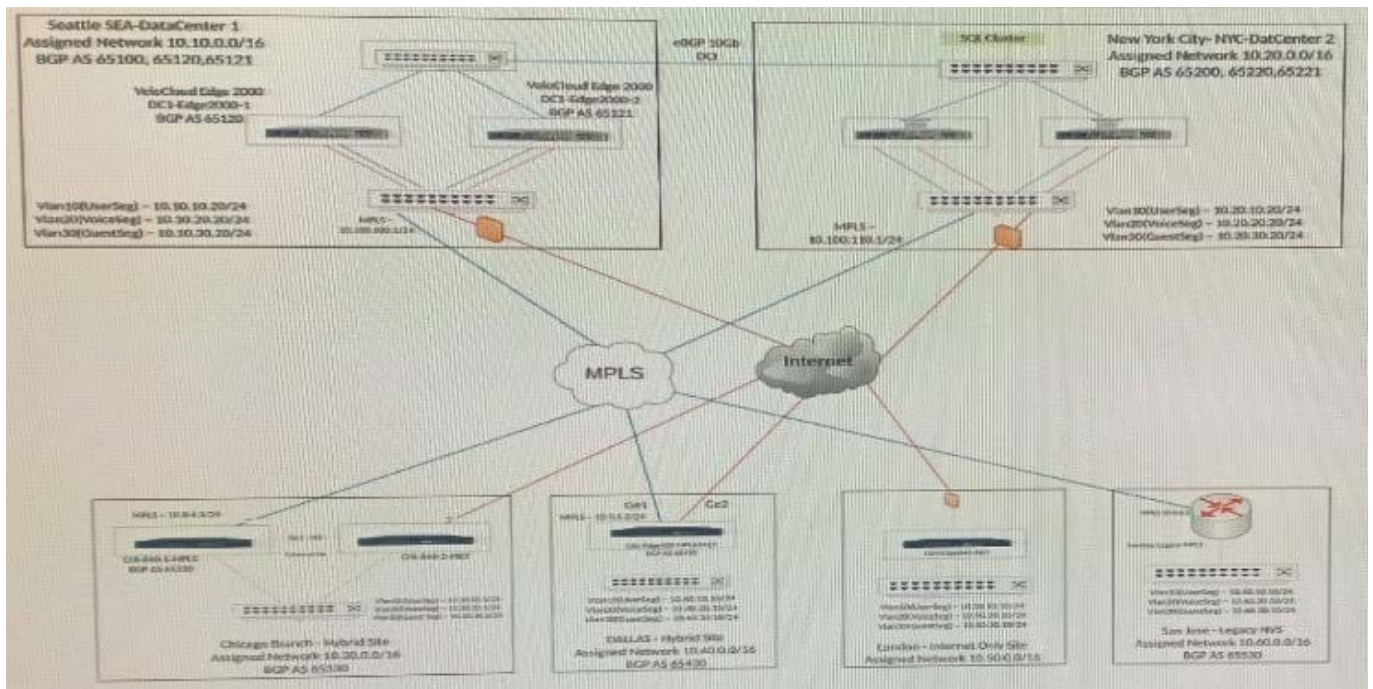

QUESTION 5

Scenario 3:

After resolving numerous connectivity Issues throughout the various branch sites, connectivity between applications and users is finally present. The network administrator is informed that during certain tests, applications are not performing as they are expected to. Users report that call quality has not fully improved and that some of their calls either drop or have poor voice quality where the conversation is breaking up. Other users are noticing that file transfers are slower than expect. A group of users from a few sites have reported slowness in accessing internal and external applications.

Exhibit.

The network administrator has been made aware that Chicago is receiving traffic from non- SD-WAN sites, bottlenecking Chicago's interfaces. The network administrator's VMware SE has mentioned using the uplink feature to help resolve this.

What are two ways the uplink feature should be used in this scenario? (Choose two.)

- A. Set the uplink community to forward traffic to a group of neighbors.
- B. Direct all traffic to that neighbor designated as an uplink,
- C. Stop mutual redistribution of routes from underlay and overlay.
- D. Prevent the site in question from becoming a transit site.

Correct Answer: BD
