## QUESTION 1

Note: This question is part of a series of questions that use the same or similar answer choices. An answer may be correct for more than one question in the series. Each question is independent of the other questions in this series.

Information and details provided in a question apply only to that question.

Your network contains an Active Directory domain named contoso.com. The domain contains 10 domain controllers and a read-only domain controller (RODC) named RODC01.

You plan to deploy a child domain for contoso.com in Microsoft Azure.

To the Azure subscription, you add several virtual machines that have a Server Core installation of Windows Server 2012 R2.

You need to create the new domain on one of the virtual machines.

Which command should you use?

- A. the ntdsutil command
- B. the Set-ADDomain Windows PowerShell cmdlet
- C. the Install-ADDSDomain Windows PowerShell cmdlet
- D. the dsadd command
- E. the dsamain command
- F. the dsmgmt command
- G. the net user command
- H. the Set-ADForest Windows PowerShell cmdlet

Correct Answer: C

## QUESTION 2

Your network contains an Active Directory domain named contoso.com. The domain contains a server named Server1 that runs Windows Server 2012 R2. Server1 has the Network Policy Server role service installed.

You plan to configure Server1 as a Network Access Protection (NAP) health policy server for VPN enforcement by using the Configure NAP wizard.

You need to ensure that you can configure the VPN enforcement method on Server1 successfully.

What should you install on Server1 before you run the Configure NAP wizard?

- A. A computer certificate
- B. A system health validator (SHV)
- C. The Remote Access server role
- D. The Host Credential Authorization Protocol (HCAP)

Correct Answer: A

#### Configure Policies for VPN Enforcement

The NAP health policy server uses the Network Policy Server (NPS) role service with configured network policies, health policies, and system health validators (SHVs) to evaluate client health based on administrator defined requirements.

Based on the results of this evaluation, NPS instructs the virtual private network (VPN) server to provide full access to compliant NAP client computers and to restrict access to noncompliant client computers when NAP is deployed using full

enforcement mode.

Before performing this procedure, you must install a certificate for Protected Extensible Authentication Protocol (PEAP) authentication. For more information, see [Install a Computer Certificate for PEAP](#)

Configure NAP

**Select Network Connection Method For Use with NAP**

**Network connection method:**  
Select the network connection method that you want to deploy on your network for NAP-capable client computers. Created policies will work with this network connection type only. To create policies for additional network connection methods, you can run the wizard again.

Virtual Private Network (VPN) ▼

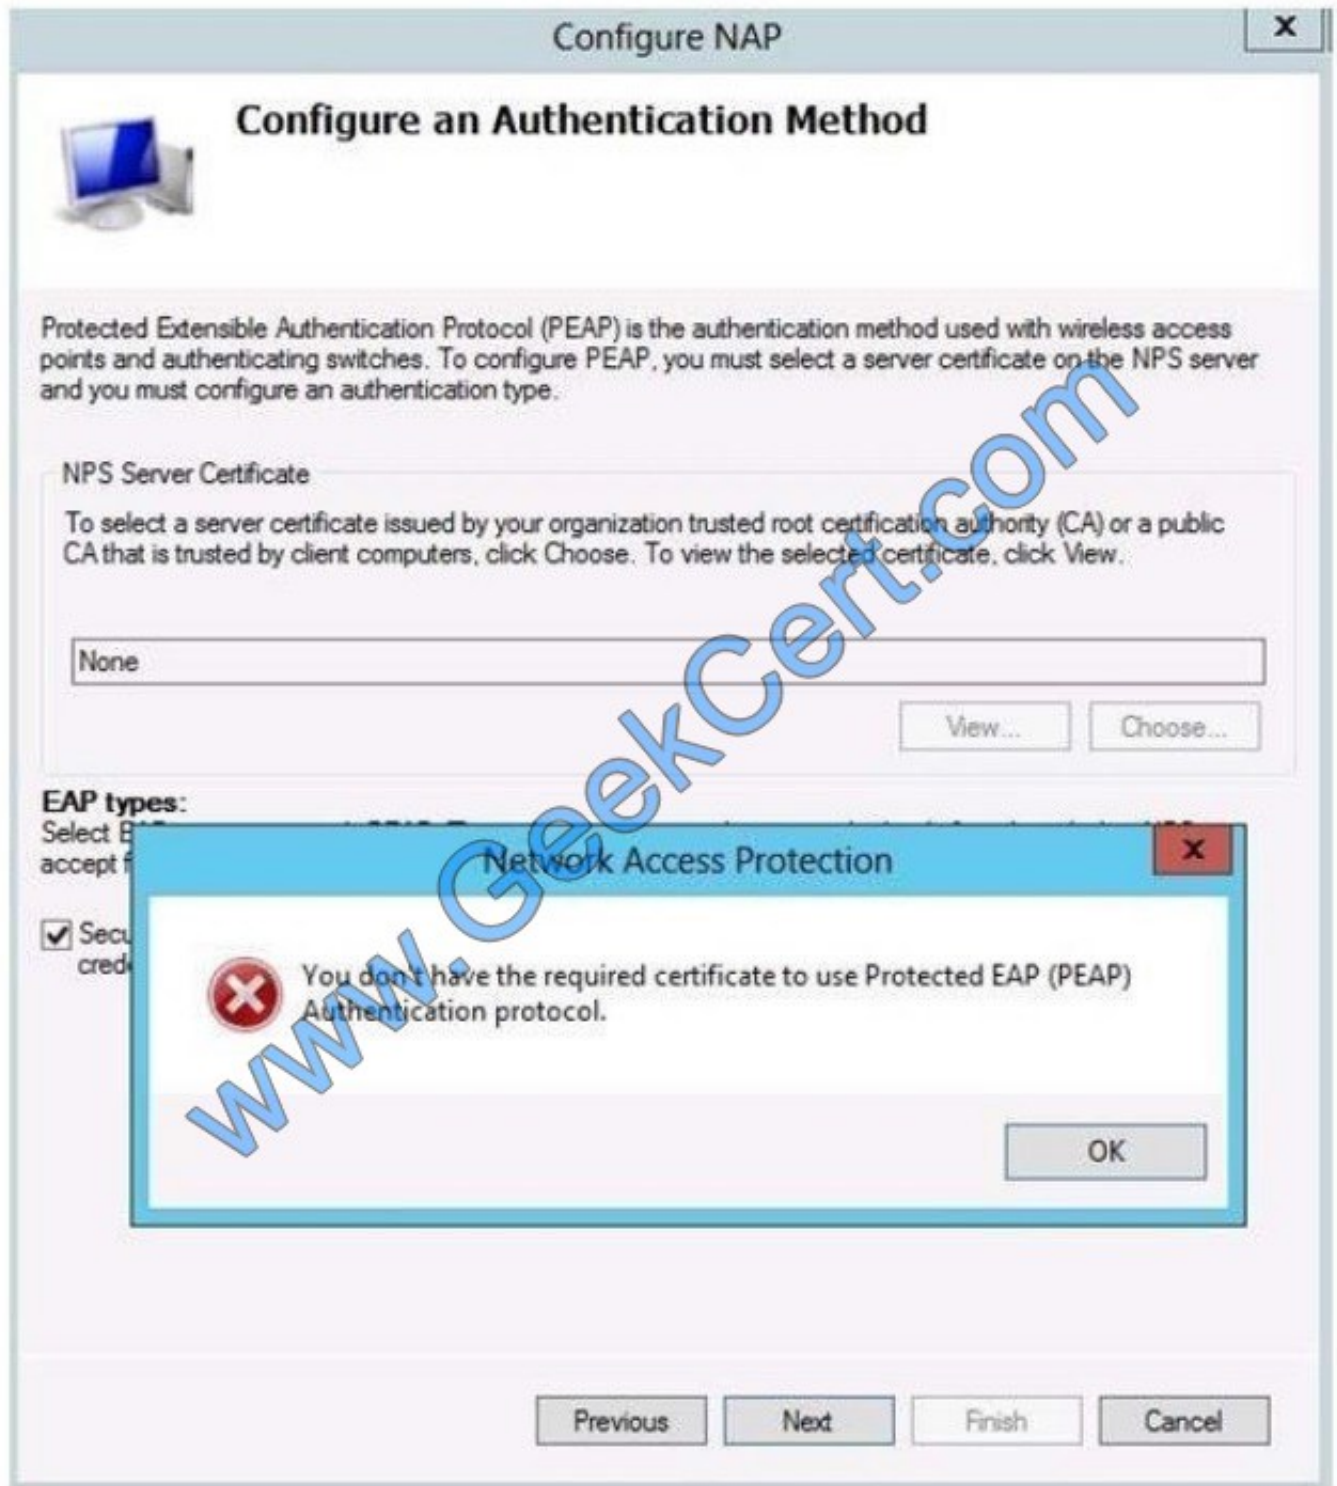

**Policy name:**  
This default text is used as part of the name for each of the policies created with this wizard. You can use the default text or modify it.

NAP VPN

**Additional requirements:**  
You must perform additional actions to set up NAP. View additional NAP requirements by clicking on the link below.  
[Additional Requirements](#)

Previous Next Finish Cancel

You cannot continue without a valid certificate:

### QUESTION 3

Your network contains an Active Directory domain named contoso.com. Domain controllers run either Windows Server 2008 R2 Service Pack 1 (SP1) or Windows Server 2012 R2.

A support technician accidentally deletes a user account named User1.

You need to use tombstone reanimation to restore the User1 account.

Which tool should you use?

- A. Active Directory Administrative Center
- B. Ntdsutil
- C. Ldp
- D. Esentutl

Correct Answer: C

ADAC would be the perfect solution if this environment was in 2008 R2 functional level; however, it is currently below that due to there being a Windows Server 2003 DC. This means you must use the LDP utility as previously.

If you plan to enable Active Directory Recycle Bin in Windows Server 2012, consider the following:

- By default, Active Directory Recycle Bin is disabled. To enable it, you must first raise the forest functional level of your AD DS or AD LDS environment to that host instances of AD LDS configuration sets be running Windows Server 2008 R2 or higher.
- The process of enabling Active Directory Recycle Bin is irreversible. After you enable Active Directory Recycle Bin in your environment, you cannot disable it.
- To manage the Recycle Bin feature through a user interface, you must install the version of Active Directory Administrative Center in Windows Server 2012.

#### QUESTION 4

You have a Hyper-V host named Server1 that runs Windows Server 2012 R2 Datacenter. Server1 is located in an isolated network that cannot access the Internet.

On Server1, you install a new virtual machine named VM1. VM1 runs Windows Server 2012 R2 Essentials and connects to a private virtual network.

After 30 days, you discover that VM1 shuts down every 60 minutes.

You need to resolve the issue that causes VM1 to shut down every 60 minutes.

What should you do?

- A. On VM1, run slmgr.exe and specify the /ipk parameter.
- B. On Server1, run slmgr.exe and specify the /rearm-sku parameter.
- C. Create a new internal virtual network and attach VM1 to the new virtual network.
- D. On Server1, run Add-WindowsFeatureVolumeActivation.

Correct Answer: A

### QUESTION 5

Your company has a main office and a branch office.

The network contains an Active Directory domain named contoso.com.

The main office contains a domain controller named DC1 that runs Windows Server 2012 R2.

DC1 is a DNS server and hosts a primary zone for contoso.com. The branch office contains a member server named Server1 that runs Windows Server 2012 R2. Server1 is a DNS server and hosts a secondary zone for contoso.com.

The main office connects to the branch office by using an unreliable WAN link.

You need to ensure that Server1 can resolve names in contoso.com if the WAN link is unavailable for three days.

Which setting should you modify in the start of authority (SOA) record?

- A. Retry interval
- B. Refresh interval
- C. Expires after
- D. Minimum (default) TTL

Correct Answer: C

Used by other DNS servers that are configured to load and host the zone to determine when zone data expires if it is not renewed
