QUESTION 1

You have two databases named DB1 and DB2 that are located on the same server.

You plan to create a stored procedure named SProc1 in DB1.

SProc1 will query a table named Table2 in DB2.

You need to recommend a solution to ensure that SProc1 can access Table2 without granting users direct access to Table2.

What should you include in the recommendation?

More than one answer choice may achieve the goal. Select the BEST answer.

A. Contained databases

B. Application roles

C. Cross-database ownership chaining

D. Digital certificates

Correct Answer: B

An application role is a database principal that enables an application to run with its own, user-like permissions. You can use application roles to enable access to specific data to only those users who connect through a particular application.

Unlike database roles, application roles contain no members and are inactive by default.

Reference: Application Roles

QUESTION 2

You need to recommend a disk monitoring solution that meets the business requirements.

What should you include in the recommendation?

A. An audit

B. A dynamic management view

C. A maintenance plan

D. A SQL Server Agent alert

Correct Answer: B

QUESTION 3

You are the senior database administrator at Contoso, Ltd. You manage a SQL Server 2014 Instance, with multiple databases used for reporting.

You have recently hired a junior database administrator. You want this person to be able to view the database structures on the server, but you do not want him or her to be able to make changes or see the data in the tables.

The new hire\\'s login credentials are as follows:

Login name: JFree

Password: Jx672$qse

You want the new hire to be required to change his password on his next login. The code that is produced should execute no matter the initial database context in which it is started.

You need to write the code required to give the new hire only the desired access, using the smallest number of steps. Develop the solution by selecting and arranging the required code blocks in the correct order. You may not need all of the code blocks.

Select and Place:

Code Blocks

```
USE Tempdb;
CREATE LOGIN [JFree] WITH PASSWORD ='Jx672$qse'
MUST_CHANGE, CHECK_EXPIRATION = ON;
```

```
USE MASTER;
CREATE LOGIN [JFree] WITH PASSWORD ='Jx672$qse'
CHANGE ON LOGIN, CHECK_EXPIRATION = ON;
```

```
GRANT VIEW SERVER STATE TO [JFree];
```

```
USE Master;
CREATE LOGIN [JFree] WITH PASSWORD ='Jx672$qse'
MUST_CHANGE, CHECK_EXPIRATION = ON;
```

```
ALTER SERVER ROLE [securityadmin] ADD MEMBER
[JFree];
```

```
GRANT CONNECT ANY DATABASE TO [JFree];
GRANT SELECT ALL USER SECURABLES TO [JFree];
```

```
GRANT VIEW ANY DEFINITION TO [JFree];
GRANT CONNECT ANY DATABASE TO [JFree];
```

Answer Area

Correct Answer:

Code Blocks

```
USE Tempdb;
CREATE LOGIN [JFree] WITH PASSWORD ='Jx672$qse'
MUST_CHANGE, CHECK_EXPIRATION = ON;
```

```
USE MASTER;
CREATE LOGIN [JFree] WITH PASSWORD ='Jx672$qse'
CHANGE ON LOGIN, CHECK_EXPIRATION = ON;
```

```
GRANT VIEW SERVER STATE TO [JFree];
```

```
GRANT CONNECT ANY DATABASE TO [JFree];
GRANT SELECT ALL USER SECURABLES TO [JFree];
```

Answer Area

```
USE Master;
CREATE LOGIN [JFree] WITH PASSWORD ='Jx672$qse'
MUST_CHANGE, CHECK_EXPIRATION = ON;
```

```
ALTER SERVER ROLE [securityadmin] ADD MEMBER
[JFree];
```

```
GRANT VIEW ANY DEFINITION TO [JFree];
GRANT CONNECT ANY DATABASE TO [JFree];
```

Note:

* MUST_CHANGE

Applies to: SQL Server 2008 through SQL Server 2014.

Applies to SQL Server logins only. If this option is included, SQL Server prompts the user for a new password the first time the new login is used.

* The VIEW DEFINITION permission lets a user see the metadata of the securable on which the permission is granted. However, VIEW DEFINITION permission does not confer access to the securable itself. For example, a user that is

granted only VIEW DEFINITION permission on a table can see metadata related to the table in the sys.objects catalog view. However, without additional permissions such as SELECT or CONTROL, the user cannot read data from the table.

QUESTION 4

You need to recommend a solution for the planned changes to the customer classifications.

What should you recommend? (Each correct answer presents part of the solution. Choose all that apply.)

A. Add a row to the Customers table each time a classification changes.

B. Add columns for each classification to the Customers table.

C. Add a table to track any changes made to the classification of each customer.

D. Add a column to the Classifications table to track the status of each classification.

E. Implement change data capture.

Correct Answer: CD

* scenario: You plan to change the way customers are classified. The new classifications will have four levels based on the number of orders. Classifications may be removed or added in the future.

Incorrect:

not E: Change data capture provides information about DML changes on a table and a database. By using change data capture, you eliminate expensive techniques such as user triggers, timestamp columns, and join queries.

QUESTION 5

You plan to deploy three highly available SQL Server environments that will use SQL Server 2014. You identify the following specifications for each environment as shown following table.

| Environment	Number of nodes	SQL Server edition	Automatic failover required
ENV1	3	Standard	Yes
ENV2	3	Enterprise	Yes
ENV3	4	Enterprise	Yes

You need to recommend which high-availability feature is required for each environment.

Which features should you identify? To answer, drag the appropriate feature to the correct requirement in the answer area.

Select and Place:

Correct Answer:

Features		Answer Area	
AlwaysOn availability groups		ENV1	database mirroring
database mirroring		ENV2	AlwaysOn availability groups
log shipping		ENV3	AlwaysOn availability groups
peer-to-peer replication			
* Always on availability groups

The AlwaysOn Availability Groups feature is a high-availability and disaster-recovery solution that provides an enterprise-level alternative to database mirroring.

Introduced in SQL Server 2012, AlwaysOn Availability Groups maximizes the availability of a set of user databases for an enterprise. Deploying AlwaysOn Availability Groups requires a Windows Server Failover Clustering (WSFC) cluster.
