**QUESTION 1**

You have a virtual machine named VM1 that runs Windows Server 2016. VM1 hosts a service that requires high network throughput.

VM1 has a virtual network adapter that connects to a Hyper-V switch named vSwitch1. vSwitch1 has one network adapter. The network adapter supports Remote Direct Memory Access (RMDA), the Single Root I/O Virtualization (SR-IOV) interface, Quality of Service (QoS), and Receive Side Scaling (RSS).

You need to ensure that the traffic from VM1 can be processed by multiple networking processors. Which Windows PowerShell command should you run on the host of VM1?

A. Set-NetAdapterRss

B. Set-NetAdapterRdma

C. Set-NetAdapterSriov

D. Set-NetAdapterQoS

Correct Answer: A

The Set-NetAdapterRss cmdlet sets the receive side scaling (RSS) properties on a network adapter. RSS is a scalability technology that distributes the receive network traffic among multiple processors by hashing the header of the incoming packet. Without RSS Windows Server 2012/2016; network traffic is received on the first processor which can quickly reach full utilization limiting receive network throughput. Many properties can be configured using the parameters to optimize the performance of RSS. The selection of the processors to use for RSS is an important aspect of load balancing. Most of the parameters for this cmdlet help to determine the processors used by RSS.

**QUESTION 2**

You are designing a cloud architecture for an organizational data mart that has an uncompressed data size of 1.1TB. The data size is static. Users from Europe, Asia, and North America will access the data for reporting purposes.

You need to recommend a solution to provide local read access to the data for each region. The solution must minimize the amount of administrative overhead.

What is the best recommendation to achieve the goal? More than one answer choice may achieve the goal. Select the BEST answer.

A. Deploy the Microsoft SQL Server AlwaysOn template from Azure Marketplace.

B. Provision a Microsoft Azure SQL data warehouse.

C. Provision Microsoft SQL Server Enterprise on a Microsoft Azure virtual machine.

D. Provision a Microsoft Azure SQL database.

Correct Answer: D

References: https://docs.microsoft.com/en-us/azure/sql-database/sql-database-designing-cloud-solutions-for-disaster-recovery#scenario-3-application-relocation-to-a-different-geography-without-data-loss-and-near-zero-downtime

**QUESTION 3**

You have a Microsoft Azure tenant.

You need to provision a new Azure Database for MySQL server database in the tenant.

Solution: You run the az sql db create command from Azure Cloud Shell.

Does this meet the goal?

A. Yes

B. No

Correct Answer: B

This would create an Azure SQL database.

**QUESTION 4**

Note: This question is part of a series of questions that use the same or similar answer choices. An answer choice may be correct for more than one question in the series. Each question is independent of the other questions in this series.

Information and details provided in a question apply only to that question.

You have a two-node Hyper-V cluster named Cluster1 at a primary location and a stand- alone Hyper-V host named Server1 at a secondary location.

A virtual machine named VM1 runs on Cluster1.

You configure a Hyper-V Replica of VM1 to Server1.

You need to perform a Test Failover of VM1.

Which tool should you use?

A. the clussvc.exe command

B. the cluster.exe command

C. the Computer Management snap-in

D. the configurehyperv.exe command

E. the Disk Management snap-in

F. the Failover Cluster Manager snap-in

G. the Hyper-V Manager snap-in

H. the Server Manager app

Correct Answer: G

**QUESTION 5**

You plan to configure auditing for a Microsoft SQL Server instance that contains 17 databases.

You need to audit all of the SELECT statements that are executed against all of the databases. The solution must ensure that all gathered information is written to the application log.

Solution: You create a Database Audit Specification in each database.

Does this meet the goal?

A. Yes

B. No

Correct Answer: B

An auditing policy can be defined for a specific database or as a default server policy. A server policy applies to all existing and newly created databases on the server. References: https://docs.microsoft.com/en-us/azure/sql-database/sql-database-auditing
