QUESTION 1

A customer plans to monitor the performance of a Microsoft Azure SQL database.

You need to explain to the customer which metrics are used to calculate the Database Throughput Unit (DTU) percentage. Which three metrics should you identify? Each correct answer presents part of the solution.

A. Log IO percentage

B. Data IO percentage

C. CPU percentage

D. Blocked by firewall

E. Database size percentage

F. Total database size

Correct Answer: ABC

QUESTION 2

You have a server named Server1 that runs Windows Server 2016.

Sever1 is an IP Address Management (IPAM) server that collects DHCP and DNS logs and events for your entire network.

You need to enable a user named TECH1 to create pointer (PTR), host (A) and service location (SRV) records on all of the DNS servers on the network.

What should you do on Server1?

A. Run the Set-IpamCustomField cmdlet and then run the Set-IpamAddressSpace cmdlet

B. From the IPAM node in Server Manager, create a new user role and a new access policy

C. Run the Set-IpamCustomField cmdlet and then run the Set-IpamAccessScope cmdlet

D. From the IPAM node in Server Manager, create a new user role and a new access scope.

Correct Answer: D

QUESTION 3

You have an Active Directory domain named Contoso.com. The domain contains servers named Server1, Server2 and Server3 that run Windows Server 2016.

Server1 and Server2 are nodes in a Hyper-V cluster named Cluster1. You add a Hyper-V Replica Broker role named

Broker1 to Cluster1.

Server3 is a Hyper-V server. A virtual machine named VM1 runs on Server3.

Live Migration is enabled on all three servers and it is configured to use Kerberos authentication only.

You need to ensure that you can perform the migration of VM1 to Server2.

What should you do?

A. Add the Server3 computer account to the Replicator group on Server1 and Server2.

B. Modify the Delegation settings on the Server3 computer account.

C. Modify the Storage Migration settings on Server3.

D. Modify the Cluster permissions for Cluster1.

Correct Answer: B

If you have decided to use Kerberos to authenticate live migration traffic, configure constrained delegation before you proceed to the rest of the steps. To configure constrained delegation Etc.

QUESTION 4

You have a server named Server1 that runs Windows Server 2016. The Docker daemon runs on Server1.

You need to configure the Docker daemon to accept connections only on TCP port 64500.

What should you do?

A. Run the sc control command.

B. Run the New-NetFirewallRule cmdlet.

C. Modify the routing table on Server1.

D. Run the sc config command.

Correct Answer: D

QUESTION 5

Note: This question is part of a series htf questions that present the same scenario. Each question in the series contains a unique solution. Determine whether the solution meets the stated goals.

Your network contains an Active Directory domain named contoso.com. The domain contains a DNS server named

Server1. All client computers run Windows 10.

On Server1, you have the following zone configuration.

```
ZoneName                 ZoneType   IsAutoCreated  IsDsIntegrated  IsReverseLookupZone  IsSigned
--------                 --------   -------------  --------------  -------------------  --------
_msdcs.contoso.com       Primary    False          True            False                False
0.in-addr.arpa           Primary    True           False           True                 False
127.in-addr.arpa         Primary    True           False           True                 False
255.in-addr.arpa         Primary    True           False           True                 False
adatum.com               Forwarder  False          False           False
contoso.com              Primary    False          True            False                False
fabrikam.com             Primary    False          True            False                True
TrustAnchors             Primary    False          True            False                False
```

You need to ensure that all of the client computers in the domain perform DNSSEC validation for the fabrikam.com namespace.

Solution: From a Group Policy object (GPO) in the domain, you add a rule to the Name Resolution Policy Table (NRPT).

Does this meet the goal?

A. Yes

B. No

Correct Answer: A

The NRPT stores configurations and settings that are used to deploy DNS Security Extensions (DNSSEC), and also stores information related to DirectAccess, a remote access technology.

Note: The Name Resolution Policy Table (NRPT) is a new feature available in Windows Server 2008 R2. The NRPT is a table that contains rules you can configure to specify DNS settings or special behavior for names or namespaces. When performing DNS name resolution, the DNS Client service checks the NRPT before sending a DNS query. If a DNS query or response matches an entry in the NRPT, it is handled according to settings in the policy. Queries and responses that do not match an NRPT entry are processed normally.
