-  **800,000+** Satisfied Customers

QUESTION 1

You are modifying a Windows Communication Foundation (WCF) service that allows customers to update financial data. The service currently requires a transaction from the client application and is working correctly. The service contract is defined as follows. (Line numbers are included for reference only.)

```
01 <ServiceContract()>
02 Public Interface IDataUpdate
03
04     <OperationContract()>
05     <TransactionFlow(TransactionFlowOption.Mandatory)>
06     Sub Update(ByVal accountNumber As String,
07               ByVal amount As Double)
08 End Interface
09
10 Class UpdateService
11     Implements IDataUpdate
12
13     <OperationBehavior(TransactionScopeRequired:=True,
14                       TransactionAutoComplete:=True)>
15     Public Sub Update(ByVal accountNumber As String,
16                     ByVal amount As Double) Implements IDataUpdate.Update
17
18         Try
19             ...
20         Catch ex As Exception
21             ...
22         End Try
23
24     End Sub
25
26 End Class
```

The service must be modified so that client applications do not need to initiate a transaction when calling the operation. The service must use the client application's transaction if one is available. Otherwise it must use its own transaction.

You need to ensure that the service operation is always executed within a transaction.

What should you do?

- A. Replace line 05 with the following code.
- B. Replace line 13 with the following code.
