QUESTION 1

You have an Azure Stack integrated system in the perimeter network.

You need to ensure that users in the Internet can access Azure Stack Storage blobs.

Which TCP ports should you open on the firewall?

A. 20 and 21

B. 137 only

C. 80 and 443

D. 445 and 5445

Correct Answer: C

Storage Blob requires port 80 for http and port 443 for https.

QUESTION 2

DRAG DROP

You have an application that runs on Microsoft Azure.

You need to implement the application on an Azure Stack integrated system.

You verify that all the services used by the application are available in Azure Stack.

Which three actions should you perform in sequence? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Select and Place:

Actions

| Export the automation script for the application to an XML file. |
| Create a solution package. |
| Set the target location of the application to **null** and set the API version. |
| Export the automation script for the application to a JSON file. |
| Set the target location of the application to **local** and set the API version. |

Answer Area

Correct Answer:

Actions

| Export the automation script for the application to an XML file. |
| |
| Set the target location of the application to **null** and set the API version. |
| |
| |

Answer Area

| Create a solution package. |
| Set the target location of the application to **local** and set the API version. |
| Export the automation script for the application to a JSON file. |
QUESTION 3

DRAG DROP

You have an Azure Stack integrated system that is isolated from the Internet.

You download an Azure Stack update to your administrator workstation.

You need to apply the update. The solution must ensure that only the Azure Stack operator can upload update packages.

Which three actions should you perform in sequence? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Select and Place:

Actions

- Click **Update now**.
- Upload the package files.
- Create a blob container that has the Blob access type.
- Create a blob container that has the Container access type.
- Register the Microsoft.Update.Admin provider.
- Create a blob container that has the Private access type.

Answer Area

Correct Answer:

Actions

- Create a blob container that has the Blob access type.
- Create a blob container that has the Container access type.
- Register the Microsoft.Update.Admin provider.

Answer Area

- Create a blob container that has the Private access type.
- Upload the package files.
- Click **Update now.**

QUESTION 4

Note: This question is part of a series of questions that use the same scenario. For your convenience, the scenario is repeated in each question. Each question presents a different goal and answer choices, but the text of the scenario is

exactly the same in each question in this series.

Start of repeated scenario.

Your company has a main office in New York and a branch office in Toronto. Each office has a dedicated connection to the Internet. Each office has a firewall that uses inbound and outbound rules.

The company has an on-premises network that contains several datacenters. The datacenters contain multiple hypervisor deployments, including Window Server 2016 Hyper-V. The network uses Microsoft System Center for monitoring and

Windows Azure Pack for self-service.

The company has a Microsoft Azure subscription that contains several workloads. You use Azure Resource Manager templates and other automated processes to create and manage the resources in Azure.

You have an Azure Stack integrated system in the New York office. The company has a development team in the Toronto office and a development team in the New York office. The system has an offer named Offer1. Several tenants have

subscriptions based on Offer1.

You have a Hyper-V host named Server1 that runs Windows Server 2012 R2. Server1 is used for testing. The hardware on Server1 can support the deployment of the Azure Stack Development Kit.

You have a Generation 1 virtual machine named VM1 that runs Windows Server 2012 R2. VM1 is deployed to a Hyper-V host that runs Windows Server 2016. VM1 has a fixed size disk named VM1.vhdx that is 200 GB.

End of repeated scenario.

You implement a SQL Server resource provider that uses D14v2 virtual machines.

A tenant creates a SQL database that runs several heavy workloads. The tenant reports that SQL queries are slow to complete.

You need to recommend changes to the Azure Stack integrated system to reduce the amount of time required to complete the SQL queries.

What should you recommend?

A. Resize the virtual machine that provides the Microsoft SQL Server service.

B. Instruct the tenant to install Microsoft SQL Server on a virtual machine in its subscription.

C. In the Azure Stack integrated system, cluster the D14v2 virtual machines.

D. Deploy a physical server that has more resources that the D14v2 virtual machines. Install Microsoft SQL Server on the server. Add the server to the SQL Server resource provider.

Correct Answer: D

QUESTION 5

NOTE: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution,

while others might not have a correct solution.

After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

You have an Azure Stack integrated system that uses a Microsoft Azure Active Directory (Azure AD) domain named contoso.com as the identify provider. The system has a tenant subscription that contains several resources.

In contoso.com, you can create a new user named User1.

User1 reports that when signed in to the Azure stack user portal, no resources are displayed.

You need to ensure that User1 can view the resources on the portal.

Solution: On the Default Provider Subscription, you assign a role to User1.

Does this meet the goal?

A. Yes

B. No

Correct Answer: B

There are two portals in Azure Stack; the administrator portal and the user portal (sometimes referred to as the tenant portal.) The Default Provider Subscription is the administrator portal. The user needs to be assigned a role in the tenant (user) subscription, not the Default Provider (admin) subscription.
