QUESTION 1

You are creating a class that uses unmanaged resources. This class maintains references to managed resources on other objects. You need to ensure that users of this class can explicitly release resources when the class instance ceases to be needed. Which three actions should you perform? (Each correct answer presents part of the solution. Choose three.)

- A. Define the class such that it inherits from the WeakReference class.
- B. Define the class such that it implements the IDisposable interface.
- C. Create a class destructor that calls methods on other objects to release the managed resources.
- D. Create a class destructor that releases the unmanaged resources.
- E. Create a Dispose method that calls System.GC.Collect to force garbage collection.
- F. Create a Dispose method that releases unmanaged resources and calls methods on other objects to release the managed resources.

Correct Answer: BDF

QUESTION 2

You are writing a custom dictionary. The custom-dictionary class is named MyDictionary. You need to ensure that the dictionary is type safe. Which code segment should you use?

- A. `class MyDictionary : Dictionary`
- B. `class MyDictionary : HashTable`
- C. `class MyDictionary : IDictionary`
- D. `class MyDictionary { ... } Dictionary t = new Dictionary(); MyDictionary dictionary = (MyDictionary)t;`

Correct Answer: A

QUESTION 3

You develop Web-based client applications. Your team is developing a Web site for Coho Winery to handle order processing. Both sales staff and customers will use the Web site to place orders. You must develop the data component that

will be called by the Web-based application such that the Web based application meets the following criteria:

The application uses separate Web pages for sales staff and customers to place orders.

Sales staff can apply a discount to the order.

Customers cannot apply any discount to the order.

Future changes to the pricing structure can be implemented by using the minimum amount of code. You need to ensure that the data component that you develop meets the outlined criteria.

What should you do?

A. Create a Coho Winery class. The Coho Winery class must include a method named Place Order. The Place Order method must include a Boolean parameter named Sales Person. If Sales Person is True, a discount must be applied to the order.

B. Create an Order class. The Order class must include two methods named Customer Place Order and SalesPersonPlaceOrder. The CustomerPlaceOrder method must accept all the parameters that are necessary for a customer to place an order. The SalesPersonPlaceOrder method must accept all the parameters that are necessary for a sales person to place an order, including the Discount parameter.

C. Create a Customer class and a SalesPerson class. Each class must include a method named Place Order. Each method must include all the parameters that are necessary for placing an order. The Place Order method in the Sales Person class must include a parameter for discount.

D. Create an Order class. The Order class must include an overloaded method named Place Order. One version of the Place Order method must accept a parameter for discount. The parameter for discount must be used to calculate a discount on the order.

Correct Answer: D

QUESTION 4

You create Web-based client applications. You are writing a code segment that queries the following data from a database: Customer information Order information The code segment does not query the database directly. The code segment calls a stored procedure from the database to perform queries. The stored procedure returns information about a customer based on the customer ID parameter that the code segment provides. The stored procedure accepts the customer ID as an input parameter and includes only one query. The stored procedure returns the result set to the code segment by using output parameters. You need to evaluate whether the stored procedure is designed for best performance and uses the minimum amount of code. What should you conclude?

A. A client-side cursor is required to capture a result set. The current design increases unnecessary coding and complexity.

B. A server-side cursor is required to return a result set. The current design increases unnecessary coding and complexity.

C. The use of output parameters to return a result set is not necessary.

D. Two stored procedures are required to return the necessary information.

Correct Answer: C

QUESTION 5

You create a Web application. The Web application enables users to change fields in their personal profiles. Some of

the changes are not persisting in the database. You need to raise a custom event to track each change that is made to a user profile so that you can locate the error. Which event should you use?

- A. WebAuditEvent
- B. WebEventManager
- C. WebBaseEvent
- D. WebRequestEvent

Correct Answer: C
