QUESTION 1

You are writing a method to compress an array of bytes. The bytes to be compressed are passed to the method in a parameter named document. You need to compress the contents of the incoming parameter. Which code segment should you use?

- A. `MemoryStream inStream = new MemoryStream(document);GZipStream zipStream = new GZipStream (inStream, CompressionMode.Compress); byte[] result = new byte[document.Length];zipStream.Write (result, 0, result.Length); return result;`
- B. `MemoryStream stream = new MemoryStream(document);GZipStream zipStream = new GZipStream (stream, CompressionMode.Compress);zipStream.Write(document, 0, document.Length);zipStream.Close ();return stream.ToArray();`
- C. `MemoryStream outputStream = new MemoryStream();GZipStream zipStream = new GZipStream(outputStream, CompressionMode.Compress);zipStream.Write(document, 0, document.Length);zipStream.Close();return outputStream.ToArray();`
- D. `MemoryStream inStream = new MemoryStream(document);GZipStream zipStream = new GZipStream (inStream, CompressionMode.Compress); MemoryStream outputStream = new MemoryStream();int b;while ((b = zipStream.ReadByte()) != -1) { outputStream.WriteByte((byte)b);} return outputStream.ToArray();`

Correct Answer: C

QUESTION 2

You create Web-based client applications. You are creating a data access component. Several Web user controls will use the component to populate bound controls from a data source. The data source has end-user inputs. You need to ensure that the data source communicates all relevant information to the Web user controls that call your component. How should you accomplish this goal?

- A. When the data access component makes a successful call to the data source, raise and throw an exception to the Web user controls to indicate success.
- B. When the data access component makes an unsuccessful call to the data source, raise and throw an exception to the Web user controls to indicate failure.
- C. When the data access component makes a successful call to the data source, raise and throw an exception to the Web page to indicate success.
- D. When the data access component makes an unsuccessful call to the data source, handle it internally by using the data access component to indicate failure.

Correct Answer: B

QUESTION 3

You have an SQL query that takes one minute to execute. You use the following code segment to execute the SQL query asynchronously.

```
IAsyncResult ar = cmd.BeginExecuteReader();
```

You need to execute a method named DoWork() that takes one second to run while the SQL query is executing. DoWork() must run as many times as possible while the SQL query is executing. Which code segment should you use?

- A. `while (ar.AsyncWaitHandle == null) { DoWork();}dr = cmd.EndExecuteReader(ar);`
- B. `while (!ar.IsCompleted) { DoWork();}dr = cmd.EndExecuteReader(ar);`
- C. `while (Thread.CurrentThread.ThreadState == ThreadState.Running) { DoWork();}dr = cmd. EndExecuteReader(ar);`
- D. `while (!ar.AsyncWaitHandle.WaitOne()) { DoWork();}dr = cmd.EndExecuteReader(ar);`

Correct Answer: B

QUESTION 4

You create Web-based client applications. You are creating a user-assistance mechanism for a Web form. The Web form serves as a multilevel wizard for clients to set up a new inventory for items. The user-assistance mechanism must meet

the following requirements:

Enable entry-level users to understand every step of the multilevel wizard process. Ensure that users complete the multilevel wizard on their first try. You need to select the appropriate user- assistance mechanism to meet the outlined requirements. What should you do?

- A. Place a Help link and a hidden label next to each field on each step of the wizard. The label must contain a brief description of the purpose of the field. Click the Help link to make the label visible.
- B. Place a Help link at the bottom of each step of the wizard, which opens a Web-based Help document for the entire wizard.
- C. Place a description of each step of the wizard on the first page of the wizard, before the user has entered any data.
- D. Place text containing user assistance for each step of the wizard at the top of that step.

Correct Answer: D

QUESTION 5

You create Web-based client applications. You are writing a code segment that queries the following data from a database: Customer information Order information The code segment does not query the database directly. The code segment calls a stored procedure from the database to perform queries. The stored procedure returns information about a customer based on the customer ID parameter that the code segment provides. The stored procedure accepts the customer ID as an input parameter and includes only one query. The stored procedure returns the result set to the code segment by using output parameters. You need to evaluate whether the stored procedure is designed for best performance and uses the minimum amount of code. What should you conclude?

- A. A client-side cursor is required to capture a result set. The current design increases unnecessary coding and complexity.

B. A server-side cursor is required to return a result set. The current design increases unnecessary coding and complexity.

C. The use of output parameters to return a result set is not necessary.

D. Two stored procedures are required to return the necessary information.

Correct Answer: C
