QUESTION 1

You are designing a Windows application that accesses information stored on a SharePoint 2010 intranet site. The application displays employee information in a data grid sourced from a list on the Human Resources site. To filter and manipulate the employee details list, the design includes a class to cache the data that is accessed. The class keeps the SPWeb object open, but only retrieves data that is not already cached. You need to ensure proper memory utilization and resource management for the application.

Which approach should you recommend?

- A. Implement the class with the IDisposable interface and allow the .NET Framework garbage collector to automatically manage the SPWeb object disposal.
- B. Implement the class with the IDisposable interface and explicitly dispose of the SharePoint SPWeb object when you are finished using it.
- C. Implement the class as a fully managed .Net Framework object and allow the .NET Framework garbage collector to automatically manage the SPWeb object disposal.
- D. Implement the class as a fully managed .Net Framework object and explicitly manage the SPWeb object using the ISPerformanceMonitor interface.

Correct Answer: B

QUESTION 2

You are consulting with a customer who plans to scale out their SharePoint 2010 Internet farm. You recommend that they install the standard SharePoint 2010 software needed to support the Web server role, including language support software, on their servers. The new requirements for the farm include the following:

- .Two new front-end Web servers will be added to the current system to increase the performance and availability of the Internet sites.
- .The new Web servers must properly render all sites in the five languages currently supported in the farm.
- .The installation must support the addition of more languages in the future and conform to all future service pack updates.
- .The installation plan must use standard SharePoint 2010 tools and procedures.

You need to design a plan for the customer to set up the Web servers to support all of the languages and meet the requirements.

What should you recommend that the customer do next?

- A. Install a language pack for each of the languages needed to display all site pages correctly. Include each of the language-specific site templates used to create the current sites.
- B. Install the same multilingual installation packages on the Web servers that were used to install the supported languages.

C. Create the site collections needed to support the sites in all supported languages, including each of the language-specific site templates. Install a language pack for each of the supported languages.

D. Install the default language for the current farm on the two new Web servers. Then migrate all sites in the farm to these servers, including all language-specific site templates. Update the new Web servers with all necessary language packs.

Correct Answer: A

QUESTION 3

You are designing a SharePoint 2010 site. You need to design the site to meet all the following requirements:

.Your business requires a consistent structure to manage sales proposal documents across all account teams.

.The sales director must ensure that all sales documents conform to the same template.

.All sales proposals must be reviewed and approved by the sales manager.

.Every site must be created with a document library, a list of the account team members, and the account status.

Which approach should you recommend?

A. Design a site template with a standard list of account team members and a shared document library to hold the proposal documents.

B. Design a proposal content type to store proposal document metadata and a shared document library to hold the proposal documents.

C. Design a proposal content type to include required metadata information about the proposal documents. Also design a site template with a standard document library and account team members list for consistency across all account teams.

D. Design a content type that uses a Microsoft Word template for proposal documents. The content type includes required metadata. Also design a site template with a customized document library and list for consistency across all account teams.

Correct Answer: D

QUESTION 4

You are creating a plan to add new functionality into a SharePoint 2010 farm. Several artifacts must be created to provide the new capabilities. The artifacts required include the following:

.A custom site definition with company branding

.A Web Part to provide a graph of business statistics

.Custom code to calculate the business statistics

Your plan needs to include a process to create and deploy the new functionality.

Which approach should you recommend?

- A. Define the new site definition, including the company branding and all the required artifacts. Create a site using this new site definition.
- B. Define a site template built on a new site definition, which includes the company branding. Implement it on the site that includes the new artifacts. Reset IIS.
- C. Develop and test the required artifacts. Build the artifacts into a solution package. Deploy the solution package to the farm.
- D. Build the company branding and the new artifacts into a feature. Staple the new feature to an existing site definition in the farm. Reset IIS.

Correct Answer: C

QUESTION 5

You are designing a SharePoint 2010 Internet site for e-commerce. The site shows pricing information retrieved from a Microsoft SQL Server database for the deals featured each day on the home page. You need to cache the pricing data for each featured deal on the server and refresh the data with a minimum amount of network traffic.

Which approach should you recommend?

- A. Use LINQ to SharePoint from a query of the database server for the pricing data.
- B. Use AJAX code on the client from the database server.
- C. Use the server session state to cache the data.
- D. Cache the data and use a lock to control the refresh of the cache data.

Correct Answer: D
