QUESTION 1

You use BizTalk Server 2010 to send EDI purchase orders to three trading partners. All of the trading partners use the same version of the purchase order message but define custom codes for the product types. The trading partners confirm purchase order acknowledgements by email instead of through response messages. The standard purchase order schemas included with BizTalk do not include the custom product type codes for each trading partner. You need to ensure that each trading partners purchase order schema is the schema that is used for orders that are sent to them.

What should you do?

- A. Under the transaction set settings for the party, define an envelope for each trading partner. For the namespace, use the custom namespace you defined for each BizTalk schema.
- B. Under the transaction set settings for the party, define a local host setting for each trading partner. For the namespace, use the custom namespace you defined for each BizTalk schema.
- C. Under the transaction set settings for the party, define an envelope for each trading partner. For the namespace, use the default namespace defined by BizTalk for EDI messages.
- D. Under the transaction set settings for the party, define a local host setting for each trading partner. For the namespace, use the default namespace defined by BizTalk for EDI messages.

Correct Answer: A

QUESTION 2

A BizTalk Server 2010 orchestration consumes a Microsoft Windows Communication Foundation (WCF) service. A request-response call to the WCF service is made inside a non- transactional scope. The scope has an exception handler that has its Exception Object Type property set to the type of the fault operation returned from the service. The handler receives the fault message. The WCF service throws a typed fault exception named WidgetException. You need to extract the exceptions detail node from the fault message.

What should you do in the WCF send port configuration?

- A. Set the Propagate Fault Message option to True. Specify the source of the outbound WCF message body by selecting Template. In the XML expression box, enter the XML of the WidgetException message.
- B. Set the Propagate Fault Message option to True. Specify the source of the inbound BizTalk message body by selecting Path and entering the XPath expression for the WidgetException node.
- C. Set the Propagate Fault Message option to True. Specify the source of the inbound WCF message body by selecting BizTalk Request Message Body.
- D. Set the Propagate Fault Message option to True. Specify the source of the inbound BizTalk message body by selecting Envelope (soap:Envelope).

Correct Answer: B

QUESTION 3

You are developing a solution for BizTalk Server 2010. You deploy the solution to the runtime environment. The solution includes one orchestration with a direct bound send port that sends a message to the BizTalk MessageBox database for routing to a folder. After starting the BizTalk application for testing, you notice that the following error is logged in the servers event log: The published message could not be routed because no subscribers were found. This error occurs if the subscribing orchestration or send port has not been enlisted, or if some of the message properties necessary for subscription evaluation have not been promoted. Please use the BizTalk Administration console to troubleshoot this failure. You need to resolve the error without changing the code in the orchestration and without redeploying the solution.

What should you do?

- A. Add a send port that uses the XmlTransmit pipeline.
- B. Add a send port that has a filter that matches the message type.
- C. Add a receive port that uses the XmlReceive pipeline.
- D. Add a dynamic send port.

Correct Answer: B

QUESTION 4

A company uses BizTalk Server 2010 to receive electronic orders from multiple customers. You have schemas for all the order formats that the customers send. You need to create a business process that handles an incoming order. You create a canonical schema that represents an order. You also create an orchestration that handles an order of the canonical schema.

What should you do next?

- A. Create maps from each of the customer order formats to the canonical schema. Create a receive port and location and bind the port to the orchestration. Use the maps on the receive port.
- B. Create maps from each of the customer order formats to the canonical schema. Create a send port and bind it to the orchestration. Use the maps on the send port.
- C. Create maps from the canonical schema to each of the customer order formats. Create a send port and bind it to the orchestration. Use the maps on the send port.
- D. Create maps from the canonical schema to each of the customer order formats. Create a receive port and location and bind the port to the orchestration. Use the maps on the receive port.

Correct Answer: A

QUESTION 5

You are developing applications for BizTalk Server 2010. The application processes orders for two vendors. These

vendors have different message formats for their orders. You define BizTalk schemas for both vendors in separate projects and name the projects VendorA and VendorB. You promote the OrderType property in the schema of VendorA and the PurchaseType property in the schema of VendorB. Then you deploy the application. You need to log messages to disk for shoe orders for VendorA and bike orders for VendorB.

What should you do?

- A. Add a FILE send port with the filter: VendorA.OrderType==Shoes And VendorB.PurchaseType==Bikes
- B. Add a FILE send port with the filter: VendorA.OrderType==Shoes Or VendorB.PurchaseType==Bikes
- C. Add a send port group with the filter: VendorA.OrderType==Shoes Or VendorB.PurchaseType==Bikes
- D. Add a send port group with the filter: VendorA.OrderType==Shoes And VendorB.PurchaseType==Bikes

Correct Answer: B
