QUESTION 1

Your network contains a single Active Directory domain. You have 100 servers that run Windows Server 2008 R2 and 5,000 client computers that run Windows 7. You plan to deploy Applications to the client computers.

You need to recommend an Application deployment strategy that meets the following requirements:

- Applications must be deployed only to client computers that meet the minimum hardware requirements.
- Deployments must be scheduled to occur outside business hours.
- Detailed reports on the success or failure of the Application deployments must be provided.

What should you recommend?

- A. Deploy Applications by using Group Policy.
- B. Implement Windows Server Update Services (WSUS).
- C. Implement Microsoft System Center Operations Manager (SCOM) 2007 R2.
- D. Implement Microsoft System Center Configuration Manager (SCCM) 2007 R2.

Correct Answer: D

<http://technet.microsoft.com/en-us/library/bb680651.aspx>

Welcome to Microsoft System Center Configuration Manager 2007. Configuration Manager 2007 contributes to a more effective Information Technology (IT) department by enabling secure and scalable operating system and application deployment and desired configuration management, enhancing system security, and providing comprehensive asset management of servers, desktops, and mobile devices.

Post-Setup Configuration Tasks

After Setup has run, there are still a few tasks you must perform to have a functioning Configuration Manager 2007 site. For example, you might need to assign new site system roles

and install clients. For more information, see Checklist for Required Post Setup Configuration Tasks.

Common Configuration Manager Tasks

For more information about how to do common Configuration Manager 2007 tasks, see the following topics.

QUESTION 2

You need to recommend a management solution for the corporate Web sites that meets the museum's security policy. What should you include in the recommendation?

- A. Internet Information Services (IIS) Manager

- B. Remote Desktop Services (RDS)
- C. Remote Server Administration Tools (RSAT)
- D. Windows PowerShell 2.0

Correct Answer: D

RSAT isn't right because that will give them access to other tools they do not need. The admins are not required to log in, so that takes care of RDS because that means they MUST log on interactively, that leaves IIS and PowerShell.

PowerShell meets the requirements of the security policy, IIS won't

QUESTION 3

Your network consists of a single Active Directory domain. The domain contains three organizational units (OUs) named Test, Application, and Database. You need to redesign the layout of the OUs to support the following requirements:

- Prevent Group Policy objects (GPOs) that are linked to the domain from applying to computers located in the Applications OU

-

Minimize the number of GPOs

-

Minimize the number of OUs. What should you include in your design?

A.

Create a Starter GPO.

B.

Create a Windows Management Instrumentation (WMI) filter.

C.

Delegate permissions on the Application OU.

D.

Configure block inheritance on the Application OU.

Correct Answer: D

Understanding Group Policy You already know that Group Policy settings contained in Group Policy objects (GPOs) can be linked to OUs, and that OUs can either inherit settings from parent OUs or block inheritance and obtain their specific settings from their own linked GPOs. You also know that some policies--specifically, security policies--can be set to "no override" so that they cannot be blocked or overwritten and force child OUs to inherit the settings from their parents.

QUESTION 4

You are planning to deploy new servers that will run Windows Server 2008 R2. Each server will have 32 GB of RAM. The servers must support installation of the following role services:

- Routing and Remote Access
- Remote Desktop Services Gateway
- Minimize CPU and RAM usage

You need to deploy the minimum edition of Windows Server 2008 R2 that meets the requirements.

What should you recommend? (More than one answer choice may achieve the goal. Select the BEST answer.)

- A. A Server Core installation of Windows Server 2008 R2 Datacenter.
- B. A Full Installation of Windows Server 2008 R2 Enterprise.
- C. A Full Installation of Windows Server 2008 R2 Standard.
- D. A Server Core installation Windows Server 2008 R2 Web.

Correct Answer: C

QUESTION 5

You need to recommend a monitoring solution for App1 that meets the museum's technical requirements.

What should you include in the recommendation?

- A. event subscriptions
- B. Microsoft SharePoint Foundation 2010 alerts
- C. Microsoft System Center Operations Manager 2007 R2 and the SMTP service
- D. Resource Monitor

Correct Answer: A

<http://technet.microsoft.com/en-us/library/cc749183.aspx>

Event Viewer enables you to view events on a single remote computer. However, troubleshooting an issue might require you to examine a set of events stored in multiple logs on multiple computers.

Windows Vista includes the ability to collect copies of events from multiple remote computers and store them locally. To specify which events to collect, you create an event subscription. Among other details, the subscription specifies exactly

which events will be collected and in which log they will be stored locally. Once a subscription is active and events are being collected, you can view and manipulate these forwarded events as you would any other locally stored events.

Using the event collecting feature requires that you configure both the forwarding and the collecting computers.

The functionality depends on the Windows Remote Management (WinRM) service and the Windows Event Collector (Wecsvc) service. Both of these services must be running on computers participating in the forwarding and collecting process. To learn about the steps required to configure event collecting and forwarding computers, see [Configure Computers to Forward and Collect Events](#).
