QUESTION 1

You administer a Microsoft SQL Server 2014 environment. One of the SQL Server 2014 instances contains a database named Sales.

You plan to migrate Sales to Windows Azure SQL Database.

To do so, you need to implement a contained database.

What should you do? (Each correct answer presents part of the solution. Choose all that apply.)

- A. Set database containment to AZURE.
- B. Enable server property contained database authentication.
- C. Disable server property cross db ownership chaining.
- D. Set database containment to PARTIAL.
- E. Disable server property contained database authentication.
- F. database containment to FULL.

Correct Answer: BD

A contained database is a database that is isolated from other databases and from the instance of SQL Server that hosts the database.

B: In the contained database user model, the login in the master database is not present. Instead, the authentication process occurs at the user database, and the database user in the user database does not have an associated login in the master database.

SQL Database and SQL Data Warehouse support Azure Active Directory identities as contained database users.

D: The contained database feature is currently available only in a partially contained state. A partially contained database is a contained database that allows the use of uncontained features. References: <https://docs.microsoft.com/en-us/sql/relational-databases/databases/contained-databases>

QUESTION 2

A company uses several Microsoft Azure elastic pools with Azure SQL Database instances.

You have two pools named Pool1 and Pool2. Pool2 is near maximum capacity and cannot accommodate the database move.

You need to move the database from Pool1 to Pool2.

Which PowerShell cmdlets should you run? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Step

Action

One

▼
Set-AzureRmSqlElasticPool
Set-AzureRmSqlDatabase
Set-AzureRmSqlServer
Set-AzureRmSqlDatabaseAuditing

Two

▼
Set-AzureRmSqlElasticPool
Set-AzureRmSqlDatabase
Set-AzureRmSqlServer
Set-AzureRmSqlDatabaseAuditing

Correct Answer:

Step

Action

One

▼
Set-AzureRmSqlElasticPool
Set-AzureRmSqlDatabase
Set-AzureRmSqlServer
Set-AzureRmSqlDatabaseAuditing

Two

▼
Set-AzureRmSqlElasticPool
Set-AzureRmSqlDatabase
Set-AzureRmSqlServer
Set-AzureRmSqlDatabaseAuditing

QUESTION 3

You have a database named DB1.

You discover that DB1 is corrupt.

You run DBCC CHECKDB and receive an error message within a few seconds. No pages are listed in the error message.

You need to repair the database corruption as quickly as possible. The solution must minimize data loss.

What should you do?

- A. Run DBCC CHECKDB ('db1\%', REPAIR_ALLOW_DATA_LOSS).
- B. Run DBCC CHECKDB ('db1\%', REPAIR_FAST).
- C. Delete the transaction logs and restart the Microsoft SQL Server instance.
- D. Run DBCC CHECKDB ('db1\%', REPAIR_REBUILD).
- E. Restore the database from a backup.

Correct Answer: C

REPAIR_REBUILD

Performs repairs that have no possibility of data loss. This can include quick repairs, such as repairing missing rows in non-clustered indexes, and more time-consuming repairs, such as rebuilding an index.

QUESTION 4

You are the database administrator in your company. You plan to create 10 identical environments that use SQL Server 2016 as a database engine. Each environment has the following custom requirements:

Three user databases must be preinstalled.

The tempdb database must contain eight data files that are 1024 MB each. Trace flag 2371 must be turned at the instance level.

The solution must meet the following requirements:

The instance must be preconfigured.

No other database features are required in the future. The solution must use the minimum administrative effort.

You need to prepare the environments. What should you do?

- A. Provision 10 Azure virtual machines that each contain SQL Server 2016, installed by using the default settings.
- B. Create an installation configuration file and perform unattended installations of SQL Server 2016.
- C. Create a virtual machine template by using a prepared instance of SQL Server 2016.
- D. Create a virtual machine template by using a complete instance of SQL Server 2016.

Correct Answer: D

You should create a virtual machine template by using a complete instance of SQL Server 2016. You use the sysprep tool to prepare a complete instance of SQL Server 2016. By using a complete instance, SQL Server, the network, and the users are all created, and the system cannot be reconfigured during the installation process.

QUESTION 5

You plan to migrate a Microsoft sql server instance between physical servers.

You must migrate the metadata associated with the database instance.

You need to ensure that the new instance retains the existing jobs and alerts.

Solutions: You restore the model database.

Does the solution meet the goal?

A. Yes

B. No

Correct Answer: B

The model database does not handle alerts and jobs. It is used as the template for all databases created on an instance of SQL Server.

The msdb database is used by SQL Server Agent for scheduling alerts and jobs and by other features such as SQL Server Management Studio, Service Broker and Database Mail.
