QUESTION 1

Your network contains an Active Directory domain named contoso.com. Client computers run either Windows 7 or Windows 8.

You plan to replace the client computers that run Windows 7. You need to migrate the application settings and the configurations from the client computers that run Windows 7 to the client computers that run Windows 8.

What should you do?

A. On the client computers that run Windows 7, run loadstate.exe. On the client computers that run Windows 8, run scanstate.exe.

B. On the client computers that run Windows 7, run scanstate.exe. On the client computers that run Windows 8, run loadstate.exe.

C. On a server that runs Windows Server 2012, install the Windows Server Migration Tools. Run the Export-SmigServerSetting cmdlet and the Import-SmigServerSetting cmdlet.

D. On a server that runs Windows Server 2012, install the Windows Server Migration Tools. Run the Send-SmigServerData cmdlet and the Receive-SmigServerData cmdlet.

Correct Answer: B

QUESTION 2

Your network contains an Active Directory domain named contoso.com. The domain contains a Microsoft Application Virtualization (App-V) 5.0 infrastructure.

You package two complex applications named App1 and App2. You create a connection group that contains App1 and App2.

You discover that App2 overwrites some of the registry settings used by App1.

You need to recommend a solution for the deployment of App1 and App2 to meet the following requirements:

Prevent App2 from overwriting the registry settings of Appl. Ensure that App1 and App2 can share information.

What should you recommend? More than one answer choice may achieve the goal. Select the BEST answer.

A. Change the order of packages in the package library.

B. Modify the PackageId of App1.

C. Change the order of packages in the connection group.

D. Create a single package that contains App1 and App2.

E. Modify the VersionId of App1.

Correct Answer: C

http://blogs.technet.com/b/appv/archive/2012/11/06/deploying-connection-groups-app-v-5- 0.aspx

Note: The order of packages in the connection group is important. This determines the order in which the package contents are merged. So, in the following case, if there was a conflict (example: same registry value), the content of the "App1"

package would be used.

QUESTION 3

Your network contains an Active Directory domain named contoso.com.

You deploy Active Directory Certificate Services (AD CS).

You plan to deploy several applications by using RemoteApp.

Users will access the RemoteApp programs from domain-joined computers, home computers, and publicly accessible computers.

The corporate security policy requires that all RemoteApp files be digitally signed.

You need to recommend which certificate the company must use to digitally sign the RemoteApp files.

What should you recommend?

More than one answer choice may achieve the goal. Select the BEST answer.

A. A server authentication certificate from an internal certificate authority (CA)

B. A server authentication certificate from a trusted third-party certification authority (CA)

C. A self-signed code signing certificate

D. A client authentication certificate from a trusted third-party certification authority (CA)

Correct Answer: B

QUESTION 4

Your network contains an Active Directory domain named adatum.com. The domain contains a server named Server1 that runs Windows Server 2012.

You need to prevent all of the applications that run on Server1 from running code from non- executable memory regions.

What should you do?

A. From the local Group Policy, create an application control policy.

B. From BCDEdit, modify the Data Execution Prevention (DEP) settings.

C. From Windows PowerShell, run the Set-ExecutionPolicy cmdlet.

D. From the local Group Policy, create a software restriction policy.

Correct Answer: B

QUESTION 5

Your network contains servers that run Windows Server 2012 and client computers that run Windows 8.

You have a standard company image named Image.wim that contains a third-party application named Appl. Image.wim only contains one image. App1 uses a dynamic link library (DLL) file stored in C:\AppData.

A new version of App1 named App2 is available.

You need to update the DLL file in Image.wim. You want to achieve this goal by using the minimum amount of administrative effort.

Which three actions should you perform?

To answer, move the three appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Select and Place:

Actions	Answer Area
Run **dism.exe /unmount-wim /mountdir:c:\mount /commit**.	
Run **dism.exe /mount-wim / wimfile:image.wim /index:1 /mountdir:c:\mount**.	
Copy the new DLL of App1 to C:\AppData.	
Copy the new DLL of App1 to C:\Mount\AppData.	
Run **dism.exe /online /add-package:app2.dll**.	
Run **dism.exe /mount-wim / wimfile:image.wim /index:1 /mountdir:c:**.	

Correct Answer:

Actions	Answer Area
	Run **dism.exe /mount-wim / wimfile:image.wim /index:1 /mountdir:c: \mount.**
	Copy the new DLL of App1 to C:\Mount\AppData.
Copy the new DLL of App1 to C:\AppData.	Run **dism.exe /unmount-wim /mountdir:c: \mount /commit.**
Run **dism.exe /online /add-package:app2.dll.**	
Run **dism.exe /mount-wim / wimfile:image.wim /index:1 /mountdir:c:\.**	

A mount directory needs to be created before mounting an image. You would not mount an image to the root of c. Also the question only asks you to update the dll and the image isn\\'t online.
