QUESTION 1

You work as an Office Assistant for Tech Perfect Inc. The company has a Windows-based network. You are creating a business report by using Microsoft Excel 2010. You have arranged sales data as shown below:

	A	B	C	D	E
1			Target Achieved (In US\$)		
2	#	Name	2008	2009	2010
3	1	Rick	46,900	78,000	82,000
4	2	Mark	42,500	63,500	110,500
5	3	Adam	56,120	59,200	99,700
6	4	Ada	47,200	61,500	99,900
7	5	Andy	49,000	69,200	110,250
8	6	David	47,000	71,100	111,000

You want to provide pictorial representation of the trend of the sales data in front of each row. Which of the following actions will you take to accomplish the task with the least amount of administrative burden?

- A. Use stand-alone slicers.
- B. Configure form controls.
- C. Create sparklines.
- D. Create a PivotTable report.

Correct Answer: C

	Target Achieved (In US\$)				
	Name	2008	2009	2010	Trends
1	Rick	46,900	78,000	82,000	
2	Mark	42,500	63,500	110,500	
3	Adam	56,120	59,200	99,700	
4	Ada	47,200	61,500	99,900	
5	Andy	49,000	69,200	110,250	
6	David	47,000	71,100	111,000	

In order to accomplish the task with the least amount of administrative burden, use sparklines. Sparklines, introduced in Microsoft Office 2010, are tiny charts that can fit in a cell. The sparklines can be used to show trends in a small amount of

space. The sparklines visually summarize trends alongside data.

The sparklines can be added through the Insert tab.

Answer option A is incorrect. Stand-alone slicers are referenced from Online Analytical Processing (OLAP) Cube

functions. These stand-alone slicers can be connected with any PivotTable in future. They can be added by using the slicer

button on the Ribbon. They need to be manually linked into grids as required.

Answer option B is incorrect. A form control is an original control that is compatible with old versions of Excel, beginning with Excel version 5.0. It is designed for use on XLM macro sheets. It can be used when a user wants to simply interact

with cell data without using VBA code and when he wants to add controls to chart sheets. By using form controls, the user can run macros. He can attach an existing macro to a control, or write or record a new macro. These controls cannot

be added to UserForms, used to control events, or modified to run Web scripts on Web pages.

Answer option D is incorrect. A PivotTable report is used to summarize large amounts of data, to analyze numerical data, and to answer unexpected questions about data.

QUESTION 2

You work as a Sales Manager for Rainbow Inc. You are working on a report in a worksheet in Excel 2010.

You want to insert flow-chart in the sheet. Mark the option that you will choose to insert flow-chart symbols in the report. Explanation: In order to accomplish the task, you will have to choose the Shapes option. Shapes are simple objects

provided by Microsoft Office to add them to a document. A single shape or combined multiple shapes can be inserted in the document. The Office includes simple shapes, such as lines, basic geometric shapes, arrows, equation shapes,

flowchart shapes, stars, banners, and callouts. Users can add text, bullets, numbering, and Quick Styles to these shapes after inserting them in the document. Take the following steps to add a shape in a document:

Hot Area:

Correct Answer:

1. Click on the Shapes option in the Illustrations group on the Insert tab. This will open the list of shapes available

2. Choose the required shape from the list.

QUESTION 3

You work as an Office Assistant for Tech Perfect Inc. You are working in the spreadsheet of the company's high selling products. You are trying to intersect two ranges that do not intersect each other. Which of the following errors will be occurred in this situation?

- A. #VALUE!
- B. #NAME?
- C. #NULL!

D. #DIV/0!

Correct Answer: C

The #NULL! error is produced by Excel when a user attempts to intersect two ranges that do not intersect each other. This error can be resolved by reviewing the formula and then either by changing the variables to ensure that the user is getting a valid intersection or by using the Excel Iferror function to identify a null range and take the required action. Answer option D is incorrect. Excel #DIV/0! is produced when a formula attempts to divide by zero and a division by zero produces infinity that cannot be represented by a spreadsheet value. This error can be corrected or overcome by using the Excel IF function to identify a possible division by zero and produce an alternative result. Answer option A is incorrect. The #VALUE! Excel formula error occurs when any of the variables in a formula is of the wrong type. To correct this error, it is required to check each individual part of the formula to make sure that the correct argument types are used. If the function contains nested functions, the best way is to copy each of the arguments into a separate cell to check what they evaluate to. If the formula contains a number of terms, break down each term further to find out its components, until the source of the error is found. Answer option B is incorrect. The #NAME? error occurs when Excel encounters text in a formula and tries to interpret that text as a reference, a named range, or a function name but is not able to recognize the text as any of these. The best way to approach the #NAME? Excel function error is to check the correct spelling of the function names, references, and named ranges and to check that the variables used as text values are entered in double quotes. If the formula contains nested functions, it is required to check the results of these individually, until the source of the error is identified.

QUESTION 4

You work as an Office Assistant for Media Perfect Inc. You have created a spreadsheet in Excel 2010 and shared it with the other employees of the company. You select the Encrypt with Password option as a protection measure for the document you are sharing. Now, you have to specify a password in the Password box in the Encrypt Document dialog box appeared for editing the document. But you have forgotten the password. What will happen in this situation?

- A. You will use a new password.
- B. You will ask Microsoft to retrieve the password.
- C. You will fetch the password from the list in which you have saved it.
- D. You will create a new document.

Correct Answer: C

The various Protect Workbook options are as follows:

1.

Mark as Final: This option is used to make the document read-only. When a spreadsheet is marked as final, various options such as typing, editing commands, and proofing marks are disabled or turned off and the spreadsheet becomes read-only. This command helps a user to communicate that he is sharing a completed version of a spreadsheet. This command also prevents reviewers or readers from making inadvertent modifications to the spreadsheet.

2.

Encrypt with Password: When a user selects the Encrypt with Password option, the Encrypt Document dialog box appears. In the Password box, it is required to specify a password. Microsoft is not able to retrieve lost or forgotten passwords, so it is necessary for a user to keep a list of passwords and corresponding file names in a safe place.

3.

Protect Current Sheet: This option is used to select password protection and permit or prohibit other users to select, format, insert, delete, sort, or edit areas of the spreadsheet. This option protects the worksheet and locked cells.

4.

Protect Workbook Structure: This option is used to select password protection and select options to prevent users from changing, moving, and deleting important data. This feature enables a user to protect the structure of the worksheet.

5.

Restrict Permission by People: This option works on the basis of Window Rights Management to restrict permissions. A user is required to use a Windows Live ID or a Microsoft Windows account to restrict permissions. These permissions can be applied via a template that is used by the organization in which the user is working. These permissions can also be added by clicking Restrict Access.

6.

Add a Digital Signature: This option is used to add a visible or invisible digital signature. It authenticates digital information such as documents, e-mail messages, and macros by using computer cryptography. These signatures are created by specifying a signature or by using an image of a signature for establishing authenticity, integrity, and non-repudiation.

Answer option D is incorrect. You can create a new document with the same details but it will increase the overhead and is a very time consuming process. Answer option D is incorrect. You can create a new document with the same details but it will increase the overhead and is a very time consuming process.

QUESTION 5

Rick works as an Office Assistant for Tech Perfect Inc. He is creating a user form through Microsoft Excel 2010. While creating forms for a number of users, he is required to repeat some of the actions multiple times. It is a very time consuming process. To resolve this issue, he wants to record the sequence of actions to perform a certain task and to play them back in the same order. Which of the following actions will Rick take to accomplish the task?

- A. He will use the Trust Center bar.
- B. He will use the Evaluate Formula tool.
- C. He will put the workbook in a trusted location.
- D. He will create and run a macro.

Correct Answer: D

A macro is defined as a tool that permits a user to automate tasks and add several functionalities to forms, reports, and controls. For example, if a user adds a command button to a form, he associates the button's OnClick event to a macro,

and the macro consists of the commands that are to be performed by the button each time it is clicked. The macro records the user's mouse clicks and keystrokes while he works and lets him play them back later. The macro can be used to

record the sequence of commands that the user uses to perform a certain task. When the user runs the macro, it plays those exact commands back in the same order.

Answer option B is incorrect. Evaluate Formula is a formula examination tool provided by Microsoft Excel. This tool is useful for examining formulas that do not produce any error but are not generating the expected result.

Answer options A and C are incorrect. The benefit of connecting to external data from Microsoft Excel is that a user can automatically update Excel workbooks from the real data source whenever the data source is updated with new

information. It is possible that the external data connection might be disabled on the computer. For connecting to the data source whenever a workbook is opened, it is required to enable data connections by using the Trust Center bar or by

putting the workbook in a trusted location.
