QUESTION 1

You need to encrypt data by using a public key and a private key. Which .NET class should you use?

- A. DESCryptoServiceProvider
- B. RijndaelManaged
- C. DSACryptoServiceProvider
- D. TripleDESCryptoServiceProvider

Correct Answer: C

You can use the DSACryptoServiceProvider class to create digital signatures and protect the integrity of your data.

To use a public-key system to digitally sign a message, the sender first applies a hash function to the message to create a message digest. The sender then encrypts the message digest with the sender's private key to create the sender's

personal signature.

QUESTION 2

Which file contains the required .NET settings for an ASP.NET web application?

- A. Default.aspx
- B. Web.config
- C. Global.asax
- D. Site.master

Correct Answer: B

QUESTION 3

An event declaration is shown in the following code segment.

```
Public event NewProductEventHandlerNewProduct;
```

What is NewProductEventHandler in the event declaration?

- A. A built-in data type for handling events.
- B. An enumeration that defines the type of the NewProduct variable.
- C. The name of the delegate that will dispatch the event.
- D. The name of the class method that will catch the event.

Correct Answer: C

QUESTION 4

Which two goals can you achieve by using cryptography? (Choose two.)

- A. Prevent data from being modified.
- B. Ensure that data originates from a particular party.
- C. Ensure that data arrives at its destination.
- D. Find out which users can access data.

Correct Answer: AC

QUESTION 5

Connection strings in the web.config file are:

- A. Stored in binary format.
- B. Automatically encrypted by the web server.
- C. Stored in clear text unless they are encrypted.
- D. Automatically encrypted when the project is published.

Correct Answer: C

When working with data source controls it is recommended that you centralize the location of your connection strings by storing them in the application's Web.config file. This simplifies the management of connection strings by making them available to all of the ASP.NET pages in a Web application. In addition, you do not need to modify numerous individual pages if your connection string information changes. Finally, you can improve the security of sensitive information stored in a connection string, such as the database name, user name, password, and so on, by encrypting the connection string section of the Web.config file using protected configuration.
