QUESTION 1

Multiple local, site-developed preprocessors can be used to process source files in a local project. A property group can be used to specify the location and options for each preprocessor used. What should be done to support a single build operation where the same preprocessor is invoked more than once, but with different options for each invocation?

A. create multiple property groups and for each property group specify a different set of preprocessor options

B. create multiple property groups, one for each preprocessor option used

C. create a single property group, add the preprocessor to the property group multiple times, each with a different set of options

D. create a single property group, add the preprocessor to the property group, and specify all the options in the order they are used

Correct Answer: C

QUESTION 2

When using the IBM?SCLM Developer Toolkits, you can use the SCLM view to work directly with host artifacts such as COBOL or PL/I programs. Which modes does the SCLM view provide?
