Think of ndmpcopy as a sort of ftp for SAN. You can use it to copy files from one volume to another. Because the file is read from one volume and written to another, the constraints of volume types are not an issue.

QUESTION 3

What happens when two aggregates are rejoined?

A. It is not possible to rejoin aggregates.

B. Data ONTAP will always retain data from the newest aggregate.

C. Both aggregates revert to the last common snapshot before the split.

D. You will have a large new aggregate containing all volumes from both aggregates.

E. One of the aggregates will be overwritten and you will lose any data changed on it after the split.

Correct Answer: E

When you rejoin split aggregates, Data ONTAP mirrors the data from one aggregate to the other and destroys data that existed on that aggregate before the rejoin. https://library.netapp.com/ecmdocs/ECMP1196991/html/GUID-B9CB3DA8E1AF-4BAC-A85B- 64C009010F4A.html
