- C. L4-5
- D. L5-S1

Correct Answer: D

QUESTION 3

During a clinical study examining the effects of exercise, men between the ages of 20 and 30 years are evaluated during a 15-minute session on a treadmill. The average pulse for the last 2 minutes of the session is 175/min. During the last minute of exercise, various measurements are taken. Compared with the measurement before the session, which of the following is most likely to be decreased?

- A. Cardiac output
- B. Oxygen consumption
- C. Pulse pressure
- D. Stroke volume
- E. Systolic blood pressure
- F. Total peripheral resistance

Correct Answer: F

QUESTION 4

Which of the following cranial nerves causes sensation to 1/3 of the tongue?

- A. IV
- B. VII
- C. X
- D. XI

Correct Answer: B

QUESTION 5

A 36-year-old man with profound intellectual disability is brought to the physician by staff at his facility because of increasing abdominal girth during the past 2 weeks. He is unable to speak, and no medical history is currently available. Physical examination shows a protuberant abdomen with a fluid wave and shifting dullness. There are no signs of trauma to the area. Laboratory studies show no abnormalities. A CT scan of the abdomen is shown. Fluid is present in which of the following areas as indicated by the arrow?

- A. Epiploic foramen
- B. Gastrosplenic ligament
- C. Hepatorenal pouch (of Morison)
- D. Omental bursa (lesser sac)
- E. Sulcus pericolicus

Correct Answer: D
