QUESTION 2

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution. Determine whether the solution meets the stated goals. You have the following resource group:

Resource group	Comments
DevServer_WestCentralUS	This resource group is located in the West Central US region and contains a single virtual machine (VM) named DevServer. DevServer is connected to a private subnet in an Azure Virtual Network that has no internet access.
Workstation_EastUS	This resource group is located in the East US region and contains a virtual machine named DevWorkstation. DevWorkstation is connected to a subnet in a Visual Network and is configured with a public IP address. A network security group has been configured to allow public incoming remote desktop protocol (RDP) connections to the DevWorkstation.

Developers must connect to Dev$erver onry through DevWorkstatioan. To maintain security, DevServer must not accept connections from the internet.

You need to create a private connection between the DevWortcstation and DevServer.

Solution: Configure an IP address on each subnet within the same address space.

Does the solution meet the goal?

A. Yes

B. No

Correct Answer: A

QUESTION 3

HOT SPOT

You develop a microservice solution for a company.

The solution uses the Actor design pattern for all services including mapping, GPS, and communication. The mapping and communication systems must persist state on disk. The GPS system must persist state in-memory. All Actors must

have a service replica count of three.

You need to implement code for the GPS system.

How should you complete the code segment? To answer, select the appropriate options in the answer area;
