QUESTION 1

Customers are complaining that a particular web site is "hanging". To troubleshoot the problem, a system administrator decides to trigger several thread dumps to determine which threads might be hung. How can the administrator trigger the thread dumps?

A. Use wsadmin to execute the dumpThreads command for the application server.

B. Run the collector command line script with the -Summary option set to "yes".

C. Set the node agent\\'s custom property "com.ibm.websphere.threadmonitor.dump.java" to true.

D. From the Integrated Solutions Console (ISC), click the System dump button for the application server.

Correct Answer: A

QUESTION 2

An application server needs to be diagnosed for out-of-memory issues. The system administrator will use a tool that performs the analysis of the heap dump. Which tool should the administrator use?

A. IBM Support Assistant (ISA)

B. IBM Solutions Console (ISC)

C. IBM Assembly and Deploy Tools (IADT)

D. Tivoli Performance Viewer (TPV)

Correct Answer: A

QUESTION 3

While monitoring a JDBC data source\\'s performance during a test load, a system administrator notices that there are a large number of prepared statements discarded from the cache. In order to improve application throughput, how should the administrator tune the data source?

A. Increase the size of the prepared statement cache until there are no statement discards under load.

B. Increase the maximum connection pool size and keep the prepared statement cache at its default size.

C. Set the connection pool purge policy to "EntirePool" and increase the maximum connection pool size.

D. Set the minimum connection pool size equal to the maximum connection pool size and keep the prepared statement cache at its default size.

Correct Answer: A

QUESTION 4

A system administrator needs to connect to a database from an enterprise application where global security is enabled. What security object should the administrator use?

A. Security certificate

B. J2C authentication alias

C. Basic authentication token

D. Local operating system (local OS) user id

Correct Answer: B

QUESTION 5

An application is deployed to a WebSphere Application Server ND V8.0 cluster consisting of four cluster members.

Assuming the cluster is stopped, what should a system administrator do to delete the cluster?

A. Delete the cluster.

B. Remove the cluster members and delete the cluster.

C. Uninstall the application and delete the cluster.

D. Uninstall the application, remove the cluster members and delete the cluster.

Correct Answer: A
