QUESTION 1

Which of the following is true about executing the Installation Verification Tool?

- A. The Installation Verification Tool creates profile1.
- B. The Installation Verification Tool starts the application server.
- C. The Installation Verification Tool restarts the application server.
- D. The Installation Verification Tool starts the administrative console.

Correct Answer: A

QUESTION 2

An administrator attempts an IBM Web Sphere Application Server package installation, but it fails.

What must the administrator do before making another attempt?

- A. Uninstall IBM installation Manager and reinstall it.
- B. Use Installation Manager to uninstall everything under the package, and ignore any errors.
- C. Delete everything in the product directory before uninstalling the package using Installation Manager
- D. Restore a backup copy of the previous version of the product before using Installation Manager again.

Correct Answer: C

QUESTION 3

Which type of security restricts access to the operating system from applications?

- A. Java 2 security
- B. Application security
- C. Security constraints
- D. Administrative security

Correct Answer: A

QUESTION 4

Which of the following is true about creating multiple security domains?

- A. A new security domain can be created only using the administrative console.
- B. Global security must be enabled before creating new multiple security domains.
- C. Only users assigned to the security-admin role can create new multiple security domains.
- D. If a unique name for the domain is not specified, the system will automatically create one.

Correct Answer: C

Only users assigned to the administrator role can configure multiple security domains.

QUESTION 5

Which type of fix would typically be downloaded to address a specific problem?

- A. Interim fix
- B. Cumulative fix
- C. Product fix pack
- D. Cumulative interim fix

Correct Answer: A

A WebSphere Commerce interim fix (iFix) is a software patch that contains fixes for one or more APARs. A WebSphere Commerce cumulative iFix is a comprehensive collection of interim fixes for a specific release. Both types of fixes are installed with the WebSphere Commerce Update Installer (UPDI).

Note: An Authorized Program Analysis Report, or APAR, is a formal report from IBM development to customers that have notified IBM of a problem or suspected defect. If IBM development is able to confirm the existence of the issue they will create an APAR with any known work around and perhaps an indication of which future release, if any, of the IBM program they intend to target for a formal fix to the defect and whether or not a Program Temporary Fix (PTF) is planned. The APAR will then be published so that it is visible to supported customers.
