QUESTION 1

A developer is no longer able to access a public cloud API deployment, which was working ten minutes prior.

Which of the following is MOST likely the cause?

- A. API provider rate limiting
- B. Invalid API token
- C. Depleted network bandwidth
- D. Invalid API request

Correct Answer: B

An API token is typically used to authenticate the client making API requests to the cloud API. If the token becomes invalid, either because it has expired or because it has been revoked, the client will no longer be able to access the API. This can result in the developer being unable to access the API deployment, even if it was working previously.

API provider rate limiting, depleted network bandwidth, and invalid API request can also cause issues with accessing an API deployment, but are less likely to be the cause if the API was working previously and suddenly stopped. These issues are more likely to result in a slow or inconsistent response from the API, rather than a complete inability to access it.

QUESTION 2

A developer wants to use an environment that has two sets of servers, with one active and one passive at any time. When a new version of the application is ready, it will be installed to the passive servers, which will then become active. Which of the following environment types BEST describes these two sets of servers?

- A. Disaster recovery
- B. Blue-green
- C. Development
- D. Staging

Correct Answer: B

QUESTION 3

Which of the following are advantages of a public cloud? (Choose two.)

- A. Full control of hardware
- B. Reduced monthly costs

- C. Decreased network latency
- D. Pay as you use
- E. Availability of self-service
- F. More secure data

Correct Answer: BD

QUESTION 4

Which of the following is relevant to capacity planning in a SaaS environment?

- A. Licensing
- B. A hypervisor
- C. Clustering
- D. Scalability

Correct Answer: D

Scalability is the ability of a system or service to handle increased workload or demand by adding or removing resources or capacity as needed. Scalability is relevant to capacity planning in a SaaS environment, as it can affect the performance, availability, and cost of the SaaS service. Scalability can help optimize the capacity planning process by ensuring that the SaaS service has enough resources or capacity to meet the current and future needs of the customers without wasting or underutilizing resources or capacity. QUESTION 5

A cloud engineer is troubleshooting poor performance that was reported on the corporate website. The website was configured behind a cloud application load balancer, and the following output was collected on the cloud console:

```
CDN status: configured and content replicated to edge locations.  
WAF status: 10 rules applied. 8787638 hits / 37634 blocks  
Listening on ports: 80/443  
Forwarding traffic to 5 instances (2 healthy)  
Autoscaling event count: 25
```

Based on the provided output, which of the following options is the most likely cause of the issue?

- A. The web servers are not responding properly.
- B. The web firewall is blocking legitimate traffic.
- C. The CDN should not be used during high loads.

D. Autoscaling events are too high.

Correct Answer: A
