QUESTION 1

What happens to the data when it is moved from the active tier to cloud tier?

- A. It is deduplicated and stored in a file system in the native format
- B. It is compressed and stored as object storage in a new format
- C. It is compressed and stored in block storage in a new format
- D. It is deduplicated and stored in object storage in the native format

Correct Answer: A

Explanation:

Every file has a meta-data. Meta-data of the files which is getting moved is stored on active tier and data and metadata is moved into the cloud. There is no multiple data-movement policy set on single mtree. Data moved to particular cloud

unit depends on datamovement policy. And only the unique data is sent to the cloud. This is done using the deduplication.
