#### QUESTION 1

In multinomial logistic regression, what is used to calculate the probability of outcome occurring?

- A. Logistic function applied to a linear combination of the input and outcome variables
- B. Linear regression applied to a combination of input variables
- C. Linear regression applied to a combination of input and outcome variables
- D. Logistic function applied to a linear combination of the input variables

Correct Answer: B

---

#### QUESTION 2

Consider the two sentences below. I mailed my credit card application to the bank We walked along the river bank until we came to a waterwheel

What type of NLP ambiguity might occur when interpreting the word "bank"?

- A. Discourse
- B. Syntactic
- C. Semantic
- D. Acoustic

Correct Answer: C

---

#### QUESTION 3

Which problem type is best suited for simulation?

- A. One with a few. non-random input variables
- B. One that has a closed-form solution
- C. One with numerous, non-random Input-variables
- D. One that compares "what-if scenarios

Correct Answer: D

---

#### QUESTION 4

How is the relative value of a node visualized in a sunburst?

- A. Color
- B. Area
- C. Gradient
- D. Position

Correct Answer: A

---

#### QUESTION 5

A data engineer is asked to process several large datasets using MapReduce. Upon initial inspection the engineer realizes that there are complex interdependencies between the datasets.

Why is this a problem?

- A. MapReduce works best on unstructured data
- B. There is no problem; MapReduce accommodates all the data
- C. MapReduce can only parse one file at a time.
- D. MapReduce is not ideal when the processing of one dataset depends on another.

Correct Answer: D
