- B. A new Virtual IP address should be created for each NAD.
- C. Both the primary and secondary nodes will respond to authentication requests sent to the Virtual IP address when the primary node is active.
- D. The primary node will respond to authentication requests sent to the Virtual IP address when the primary node is active.
- E. The NAD should be configured with the Virtual IP address for RADIUS authentications on the 802.1x network.

Correct Answer: DE

In an Aruba network, APs are controlled by a controller. The APs tunnel all data to the controller for processing, including encryption/decryption and bridging/forwarding data. Local controller redundancy provides APs with failover to a backup controller if a controller becomes unavailable. Local controller redundancy is provided by running VRRP between a pair of controllers. The APs are then configured to connect to the "virtual-IP" configured for the VRRP instance.
