QUESTION 1

How does a switch treat a link aggregation?

- A. The switch treats the link aggregation as one logical link for spanning tree, but it learns MAC addresses separately on each individual interface within the aggregation.
- B. The switch treats the link aggregation as one logical link. It assigns one spanning tree port role to the link aggregation, and it learns MAC addresses on the aggregation.
- C. The switch treats the link aggregation as one logical link for MAC learning, but it assigns an individual spanning tree port role to each interface within the aggregation.
- D. The switch treats each interface within the interface as a separate entity for MAC address learning; it also assigns an individual spanning tree port role to each interface.

Correct Answer: B

QUESTION 2

An ArubaOS switch operates at its factory default settings. A network administrator connects the switch to a VLAN with a DHCP server. The switch-to-switch connection carries untagged traffic. The administrator wants to use Telnet log in to the switch CLI.

How should the administrator contact the switch and log in?

- A. Contact the switch at its default IP address 172.16.0.254/24 and log in without entering a password.
- B. Contact the switch at its default IP address 192.168.1.1/24 and log in with the default password admin.
- C. Contact the switch at its DHCP-assigned IP address and log in without entering a password.
- D. Contact the switch at its DHCP-assigned IP address and log in with the default password aruba.

Correct Answer: C

QUESTION 3

A network administrator wants to download a configuration from an ArubaOS switch. The administrator does not have local access to the switch and wants to copy the configuration in a secure manner that prevents eavesdroppers from reading the configuration. Which two options can the administrator use to copy the configuration?

- A. SFTP and HTTPS
- B. ZModem and SFTP
- C. HTTPS and TFTP
- D. HTTPS and ZModem

Correct Answer: A

QUESTION 4

Refer to the exhibit.

The network consists of two ArubaOS switches with routing disabled.

How should the network administrator configure the link between Switch A and Switch B to ensure that all hosts can communicate to all the other hosts within their respective VLANs?

- A. tagged for VLAN 20 and tagged for VLAN 30
- B. untagged for VLAN 10 and tagged for VLAN 30
- C. tagged for VLAN 10 and tagged for VLAN 20
- D. untagged for VLAN 10, untagged for VLAN 20, and tagged for VLAN 30

Correct Answer: C

QUESTION 5

An ArubaOS switch is protected with a manager password. The network administrator wants to back up the configuration and apply it to other switches. The administrator wants the manager password to be available in both the saved and running configuration.

To accomplish this goal, what must the administrator do before the configuration is backed up?

- A. Enter the password command with the plaintext option.
- B. Configure an SSH keypair on the switch.
- C. Enter the include-credentials command.

D. Ensure that the server to which the configuration will be backed up uses SCP as opposed to TFTP.

Correct Answer: C
