### QUESTION 1

Hypogammaglobulinemia is often present at the time of the diagnosis.

Which one of the following clinical findings is NOT characteristic of chronic lymphatic leukaemia?

- A. Coombs test is positive in 10-20% of cases
- B. Bone marrow examination is essential to confirm the diagnosis
- C. B-lymphocytes are the leukaemia cell line in the majority of cases
- D. It converts to lymphoma

Correct Answer: A

Bone marrow examination is essential to confirm the diagnosis Chronic lymphatic leukaemia (CLL) is characterized by accumulation of small mature lymphocytes in the bone marrow and peripheral blood. The presenting features are persistent lymphocytosis, lymphadenopathy and hepatosplenomegaly. Hypogammaglobulinemia is often present at the time of the diagnosis. Autoimmune hemolytic anemia occurs in 25% of cases. The diagnosis is usually confirmed on peripheral blood examination; bone marrow examination is rarely needed. Evolution in to a more aggressive disease such as diffuse large cell lymphoma (Richter's syndrome) can occur.

### QUESTION 2

All these are anticoagulant except?

- A. Warfarine
- B. Dipyridamole
- C. Ancord
- D. Heparin
- E. Dalteparin

Correct Answer: B

---

### QUESTION 3

A 42-year-old man presents with a target shaped rash that has developed over the last several days. He was on a camping trip in the woods last week in Maine.

What is the next best step in management?

- A. Western blot
- B. Doxycycline E-Ceftriaxone
- C. ELISA

D. Serology for IgM

Correct Answer: B

A rash suggestive of Lyme is enough to indicate treatment. A 5-cm-wide targetshaped rash, particularly with a history of camping/hiking, is enough to indicate the need for antibiotic treatment with doxycycline. A characteristic rash is more specific than serology.
