QUESTION 1

A man expresses surprise that his wife has become very withdrawn during hospitalization for pneumonia.

Which response helps the husband understand how some people cope with hospitalization?

- A. "Hospitalization might cause a crisis. Has your wife had to cope with problems before this?"
- B. "Some people react that way. She will be more talkative when she feels better."
- C. "Your wife might be feeling concern that she cannot fulfill her normal roles."
- D. "This is typical behavior for someone who is as ill as your wife."

Correct Answer: A

Hospitalization might precipitate a crisis in either the client or family.

Clients might become demanding or withdrawn.

Family members might become demanding to help them cope with insecurity.

QUESTION 2

A client with sickle cell disease is worried about passing the disease on to children.

Which of the following statements by the PN is most appropriate for this client?

- A. "You should discuss this with your physician."
- B. "Sickle cell disease is genetically based and might be passed on to children."
- C. "Sickle cell disease is genetically based and is not passed on to children."
- D. "Sickle cell disease is caused by an infection and cannot be passed on to children."

Correct Answer: B

A client with sickle cell disease passes on the least sickle cell trait and possibly sickle cell disease, depending on the sickle status of the other parent.

Choice "You should discuss this with your physician." is not helpful to the client.

Choices "Sickle cell disease is genetically based and is not passed on to children." and "Sickle cell disease is caused by an infection and cannot be passed on to children." are not true.

QUESTION 3

A female client complains to the nurse at the health department that she has fatigue, shortness of breath, and

lightheadedness. Her history reveals no significant medical problems. She states that she is always on a fad diet without any vitamin supplements.

Which tests should the nurse expect the client to have first?

- A. peptic ulcer studies
- B. complete blood count, including hematocrit and hemoglobin
- C. genetic testing
- D. hemoglobin electrophoresis

Correct Answer: B

The initial tests to determine the basis for her symptoms (considering her fad dieting) should be a complete blood count, urinalysis, blood sugar, and other tests.

The decision about further testing is then made based on these results, her history, and other factors.

QUESTION 4

When performing a venipuncture, at what angle should the needle be inserted into the skin?

- A. 15-30 degrees
- B. 0-15 degrees
- C. 30-45 degrees
- D. 45-60 degrees

Correct Answer: A

QUESTION 5

The LPN is teaching a 28-year-old patient about HPV.

Which statement, if made by the patient, would warrant the need for further teaching?

- A. "I'm just so confused how I got it; my boyfriend never had any symptoms!"
- B. "It's a bummer that I'm too old for the vaccine."
- C. "It's great that HPV usually just goes away on its own."
- D. "I feel a bit better about having HPV now that I know that almost all sexually active people have it at some point."

Correct Answer: A
