QUESTION 5

A customer has created an SVM in an 8-node cluster with only FC licensed on all nodes. The customer wants to limit the number of paths visible to each host. Which three technologies accomplish this task? (Choose three.)

- A. virtual SANs (VSANs) for all FC target ports to segment specific virtual ports in mapping to the application servers
- B. SLM to limit the paths from each node to the appropriate application servers

- C. FC switch zoning of a subset of the target ports to each application server's HBAs
- D. port sets to limit the paths from each node to the appropriate application servers
- E. multipathing to limit the access to the LUNs from each host

Correct Answer: BCD

You can use FC switch zoning, portsets, and Selective LUN Map (SLM) to limit the number of paths between hosts and LUNs in configurations with multiple target ports connected to the same fabric. References:
