QUESTION 1

What is a mock object?

- A. A mock helps you create a build script
- B. Mocks, stubs, dummies, fakes and shims are all the same
- C. A mock is a way to initialize the database for testing
- D. A test object that mimics the behavior of a dependency in the system under test

Correct Answer: D

QUESTION 2

When is performance testing most effectively performed?

- A. In production during peak hours
- B. Often during the development
- C. In production
- D. Just before deployment to production

Correct Answer: B

It's best to do it often during development so that problems can be detected early. Performance testing on production will disturb the production environment.

QUESTION 3

When is it most appropriate for developers to change the Definition of Done

- A. During the sprint planning when they can't fit enough into the sprint
- B. Prior to starting a new sprint
- C. In the retrospective when it turns out they can improve quality
- D. Prior to starting a new project

Correct Answer: C

The definition of done can be changed when more is learnt. This always needs to be done aiming at a high quality usable increment. The best time to reflect on this is the retrospective.

QUESTION 4

Which of the following two best describe a ready product backlog item?

- A. It is a complete user story with all the necessary components
- B. It is well understood by the developers and product owner at the sprint planning
- C. It has been changed from unready to ready status in the tracking tool
- D. It has been fully described in the user requirements analysis
- E. It can most likely be done within one sprint

Correct Answer: BE

A ready product item needs to be able to be done in a sprint (scrum guide). In order for it to be ready, the product owner and the developers need to understand it well. Tracking tools and requirements analysis and how user stories should be made isn't part of scrum or the best practices for development.

QUESTION 5

When more teams are working on the same product. How should they go about their definition of done?

- A. Every team must make their own DoD, a meeting should be organised so that the differences are known.
- B. It depends on the product owner
- C. All development teams must have a DoD that makes their combined work releasable.
- D. Every team uses its own. The differences are discussed in a hardening sprint.

Correct Answer: C

The product must be releasable and done must mean the same for all additions to the product. So they must have a DoD that can combined. There is no hardening sprint.
